Introduction

Welcome to the User Manual of Oxygen XML Developer plugin 17.1.

Oxygen XML Developer plugin is a cross-platform application designed to accommodate all of your XML editing, authoring, developing, and publishing needs. It is the best XML editor available for document development using structured mark-up languages such as XML, XSD, Relax NG, XSL, DTD.

It offers developers a powerful *Integrated Development Environment* and the intuitive *Graphical User Interface* of Oxygen XML Developer plugin is easy to use and provides robust functionality for content editing, project management, and validation of structured mark-up sources. Coupled with *XSLT* and *FOP* transformation technologies, Oxygen XML Developer plugin offers support for generating output to multiple target formats, including: *PDF*, *PS*, *TXT*, *HTML*, *JavaHelp*, *WebHelp*, and *XML*.

This user guide is focused on describing features, functionality, the application interface, and to help you quickly get started. It also includes a vast amount of advanced technical information and instructional topics that are designed to teach you how to use Oxygen XML Developer plugin to accomplish your tasks. It is assumed that you are familiar with the use of your operating system and the concepts related to XML technologies and structured mark-up.

Getting Started

Topics:

- What is Oxygen XML Developer plugin
- Getting Familiar with the Layout
- Resources to Help You Get Started Using Oxygen XML Developer plugin
- Your First Document or Project
- Getting Help

This chapter is designed to help you get started using Oxygen XML Developer plugin as quickly as possible and to provide you with a variety of resources to help you get the most out of the application. Typically, the first step of getting started with Oxygen XML Developer plugin would be to install the software. For detailed information about that process, see the *Installation* on page 23 chapter.

After installation, when you launch Oxygen XML Developer plugin for the first time, you are greeted with a **Welcome** dialog box. It presents upcoming events, useful video demonstrations, helpful resources, the tip of the day, and also gives you easy access to recently used files and projects and to create new ones.

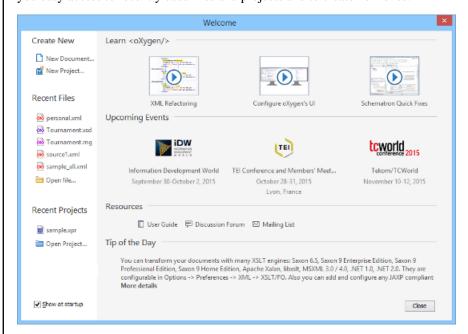

Figure 1: The Welcome Dialog Box

If you do not want it to be displayed every time you launch Oxygen XML Developer plugin, disable the **Show at startup** option. To display it any time, go to **Help** > **Welcome**.

What is Oxygen XML Developer plugin

Oxygen XML Developer plugin is the best XML editor available and is a complete XML development and authoring solution. It is designed to accommodate a large number of users, ranging from beginners to XML experts. It is the only XML tool that supports all of the XML schema languages and provides a large variety of powerful tools for editing and publishing XML documents.

You can use Oxygen XML Developer plugin to work with most XML-based standards and technologies. It is a cross-platform application available on all the major operating systems (Windows, Mac OS X, Linux, Solaris) and can be used either as a standalone application or as an Eclipse plugin.

For a list of many of the features and technologies that are included in Oxygen XML Developer plugin, see the oXygen Website.

Getting Familiar with the Layout

Oxygen XML Developer plugin includes several perspectives and editing modes to help you accomplish a wide range of tasks. Each perspective and editing mode also includes a large variety of helper view, menu actions, toolbars, and contextual menu functions.

Regardless of the *perspective* or *editing mode* that you are working with, the default layout is comprised of the following areas:

Menus

Menu driven access to all the features and functions available in Oxygen XML Developer plugin. Most of the menus are common for all types of documents, but Oxygen XML Developer plugin also includes some context-sensitive and framework-specific menus and actions that are only available for a specific context or type of document.

Toolbars

Easy access to common and frequently used functions. Each icon is a button that acts as a shortcut to a related function. Some of the toolbars are common for all perspectives, editing modes, and types of documents, while others are specific to the particular perspective or mode. Some toolbars are also framework-specific, depending on the type of document that is being edited.

Helper Views

Oxygen XML Developer plugin includes a large variety of views to assist you with editing, viewing, searching, validating, transforming, and organizing your documents. Many of the views also contain useful contextual menu actions, toolbar buttons, or menus. The most commonly used views for each perspective and editing mode are displayed by default and you can choose to display others to suite your specific needs.

Editor Pane

The main editing area in the center of the application. Each *editing mode* provides a main editor pane where you spend most of your time reading, editing, applying markup, and validating your documents. The editor pane in each editing mode also includes a variety of contextual menu actions and other features to help streamline your editing tasks.

Perspectives

Oxygen XML Developer plugin includes *several different perspectives* that you can use to work with your documents. The <oXygen/> XML perspective is the most commonly used perspective used for displaying and editing the content of your XML documents, and it is the default perspective when you start Oxygen XML Developer plugin for the first time. Oxygen XML Developer plugin also includes a Database perspective that allows you to manage databases and their connections and a few debugging perspectives that allow you to detect problems in XSLT or XQuery transformations.

Configuring Oxygen XML Developer plugin

There are numerous ways that you can configure Oxygen XML Developer plugin to accommodate your specific needs.

• See the *Configuring Oxygen XML Developer plugin* on page 533 section for details on the various ways that you can configure the application and its features.

Video Tutorials

The Oxygen XML Developer plugin website includes numerous video demonstrations and webinars that present many of the features that are available in Oxygen XML Developer plugin and show you how to complete specific tasks or how to use the various features.

• Go to the Oxygen XML Developer plugin Videos Page to see the list of video tutorials and webinars.

Oxygen XML Developer plugin Documentation

The Oxygen XML Developer plugin documentation includes a plethora of sections and topics to provide you with a variety of information, ranging from basic authoring tasks to advanced developer techniques. You can, of course, search through the documentation using standard search mechanisms, but you can also place the cursor in any particular position in the interface and use the <u>F1</u> key to open a dialog box that presents a section in the documentation that is appropriate for the context of the current cursor position. Aside from the other topics in this *Getting Started* section, the following are links to other sections of the documentation that might be helpful for your specific needs:

- Text Editing Mode on page 48 Section Provides information about the Text editor.
- Editing Documents on page 73 Section Includes information about editing a large variety of different types of documents.
- WebHelp System Output on page 385 Section Provides information about the WebHelp system that can be used for publishing content.
- *Importing Data* on page 503 Section Provides information about importing data from text files, MS Excel files, database data, and HTML files.

Sample Documents

Your installation of Oxygen XML Developer plugin includes a large variety of sample documents and projects that you can use as templates to get started and to experiment with the various features and technologies. They are located in the **samples** folder that is located in the installation directory of Oxygen XML Developer plugin. You will find files and folders for a variety of different types of documents, including the following:

- sample.xpr file A sample project file that will allow you to experiment with how projects can be structured and used. When you open this project file, you will be able to see all the sample files and folders in the **Navigator** view.
- **personal files** A collection of interrelated sample files that will allow you to experiment with the structure and relationship between XML files, stylesheets, and schemas.
- Various document type folders The various folders contain sample files for numerous different types, such as CSS, DITA, DocBook, ePub, TEI, xhtml, and many others.

Other Resources

The following list includes links to various other resources that will help you get started using the features of Oxygen XML Developer plugin:

- See the Oxygen XML Developer plugin Blog Site for a large variety of current and archived blogs in regards to numerous features, requests, and instructional topics.
- Take advantage of the *Oxygen XML Developer plugin Forum* to see various announcements and learn more about specific issues that other users have experienced.
- If you are using DITA, see the incredibly helpful DITA Style Guide Best Practices for Authors.
- To learn about the WebHelp features in Oxygen XML Developer plugin, see the *Publishing DITA and DocBook to WebHelp* section of the website.

- For more information about various additional tools that are integrated into Oxygen XML Developer plugin, see the
 Tools section.
- See the *External Resource Page* for links to various other helpful resources, such as discussion lists, external tutorials, and more.
- See the *oXygen SDK* section for details about the SDK that allows you to extend and develop Oxygen XML Developer plugin frameworks and plugins, and to integrate Eclipse plugins.
- For a list of new features that were implemented in the latest version of Oxygen XML Developer plugin, see the *What's New Section of the Website*
- You can select the **Tip of the Day** action in the **Help** menu to display a dialog box that includes a variety of tips for using Oxygen XML Developer plugin.

Your First Document or Project

This section includes several topics that will help you get started with your first document or project.

Creating a New Project

Oxygen XML Developer plugin allows you to organize your XML-related files into projects. This helps you manage and organize your files and also allows you to perform batch operations (such as validation and transformation) over multiple files. Use the *Navigator view* to manage projects, and the files and folders contained within.

Creating a New Project

To create a new project, select **New** > **XML Project** or **New** > **Sample XML Project** from the contextual menu or **File** menu. This opens a dialog box that allows you to create and customize a new project and adds it to the structure of the project in the *Navigator view*.

Adding Items to the Project

To add items to the project, select the desired document type or folder from the **New** menu of the contextual menu, when invoked from the **Navigator** view (or from the **File** menu). You can also create a document from a template by selecting **New** > **New from Templates** from the contextual menu.

Using Linked Folders (Shortcuts)

Another easy way to organize your XML working files is to place them in a directory and then to create a corresponding linked folder in you project. If you add new files to that folder, you can simply use the **Refresh** (**F5**) action from the toolbar or contextual menu and the **Navigator** view will display the existing files and subdirectories. If your files are scattered amongst several folders, but represent the same class of files, you might find it useful to combine them in a logical folder.

You can create linked folders (shortcuts) by dragging and dropping folders from the Windows Explorer (Mac OS X Finder) to the project tree, or by using the contextual menu from the location in the project tree where you want it added and selecting New > Folder > Advanced. The linked folders presented in the Navigator view are marked with a special icon. To create a file inside a linked folder, use the contextual menu and select New > File (you can use the Advanced button to link to a file in the local file system).

Note: Files may have multiple instances within the folder system, but cannot appear twice within the same folder.

For much more information on managing projects and their content, see the *The Navigator View* on page 49 section.

Getting Help

If you run into specific problems while using Oxygen XML Developer plugin you can take advantage of a variety of support related resources. Those resources include the following:

- The Oxygen XML Developer plugin Support Section of the Website
- The Oxygen XML Developer plugin Forum
- The Oxygen XML Developer plugin Video Tutorials
- The Common Problems and Solutions Section of the User Manual
- The Online Technical Support Form

The application also includes various specific help-related resources in the **Help** menu.

Installation

Topics:

- Installation Options for Oxygen XML Developer plugin
- Install Oxygen XML Developer plugin on Windows
- Install Oxygen XML Developer plugin on Mac OS X
- Install Oxygen XML Developer plugin on Linux
- Site-wide Deployment
- Obtaining and Registering a License Key for Oxygen XML Developer plugin
- Setting Up a Floating License Server for Oxygen XML Developer plugin
- Transferring or Releasing a License Key
- Upgrading Oxygen XML Developer plugin
- Uninstalling Oxygen XML Developer plugin

The platform requirements and installation instructions are presented in this chapter.

Installation Options for Oxygen XML Developer plugin

Choosing an installer

You have a choice of installers;

- The Update Site installer
- The Zip archive installer

The installation packages were checked before publication with an antivirus program to make sure they are not infected with viruses, trojan horses, or other malicious software.

Choosing a license option

You must obtain and register a license key to run Oxygen XML Developer plugin.

You can choose from two kinds of license:

- A named-person license, which can be used by a single person on multiple computers.
- A floating license, which can be used by different people at different times. Only one person can use a floating license
 at a time.

Upgrading, transferring, and uninstalling.

You can also *upgrade* Oxygen XML Developer plugin, *transfer a license*, or *uninstall* Oxygen XML Developer plugin.

Getting help with installation

If you need help at any point during these procedures, please send us an email at support@oxygenxml.com.

Install Oxygen XML Developer plugin on Windows

Choosing an Installer

You can install Oxygen XML Developer plugin on Windows using one of the following methods:

- Install using the *Update Site method*.
- Install using the *Zip archive method*.

System Requirements

System requirements for a Windows install:

Operating systems

Windows Vista, Windows 7, Windows 8, Windows 10, Windows Server 2008, Windows Server 2012

CPU

- Minimum Intel Pentium III[™]/AMD Athlon[™] class processor, 1 *GHz*
- Recommended Dual Core class processor

Memory

- Minimum 2 GB of RAM
- Recommended 4 GB of RAM

Storage

• Minimum - 400 MB free disk space

• Recommended - 1 GB free disk space

Java

On Eclipse, Oxygen XML Developer plugin uses the same Java Virtual Machine as the copy of Eclipse it is running in.

Eclipse Plugin Installation - The Update Site Method

The following Eclipse versions are officially supported: 3.6-3.8, 4.2-4.5. The steps for installing the Eclipse plugin with the Update Site method are as follows:

- 1. Start Eclipse.
- 2. Go to Help > Install New Software > Available Software.
- 3. Click Add in the Available Software dialog box.
- 4. Enter http://www.oxygenxml.com/InstData/Developer/Eclipse/site.xml into the Location field of the Add Site dialog box.
- 5. Click OK.
- 6. Select the Oxygen XML Developer plugin checkbox.
- 7. Click **Next** > and continue with the rest of the installation wizard.
- **8.** Restart Eclipse when prompted.
- 9. Verify that Oxygen XML Developer plugin is installed correctly by creating a new XML Project. Go to File > New > Other and choose Oxygen XML Developer plugin > XML Project.
- **10.** When prompted for a license key, enter the license information received in the registration email.

Note that if you already have a native version of Oxygen XML Developer plugin installed on your computer, you will not be prompted for a license key for the Eclipse version. The existing license key will be used automatically.

Eclipse Plugin Installation - The Zip Archive Method

The following Eclipse versions are officially supported: 3.6-3.8, 4.2-4.5. The steps for installing the Eclipse plugin with the Zip Archive method are as follows:

- **1.** *Download* the zip archive with the Eclipse plugin.
- 2. Unzip the downloaded zip archive in the dropins subdirectory of the Eclipse install directory.
- 3. Restart Eclipse.
- **4.** Verify that Oxygen XML Developer plugin is installed correctly by creating a new XML Project. Go to **File** > **New** > **Other** and choose **Oxygen XML Developer plugin** > **XML Project**.
- 5. When prompted for a license key, enter the license information received in the registration email.
 - Note that if you already have a native version of Oxygen XML Developer plugin installed on your computer, you will not be prompted for a license key for the Eclipse version. The existing license key will be used automatically.

Install Oxygen XML Developer plugin on Mac OS X

Choosing an Installer

You can install Oxygen XML Developer plugin on Mac OS X using one of the following methods:

- Install using the Update Site method.
- Install using the Zip archive method.

System Requirements

System requirements for a Mac OS X install:

Operating system

OS X version 10.6 64-bit or later

CPU

- Minimum Intel-based Mac, 1 GHz

Java

On Eclipse, Oxygen XML Developer plugin uses the same Java Virtual Machine as the copy of Eclipse it is running in.

Eclipse Plugin Installation - The Update Site Method

The following Eclipse versions are officially supported: 3.6-3.8, 4.2-4.5. The steps for installing the Eclipse plugin with the Update Site method are as follows:

- 1. Start Eclipse.
- 2. Go to Help > Install New Software > Available Software.
- 3. Click Add in the Available Software dialog box.
- **4.** Enter http://www.oxygenxml.com/InstData/Developer/Eclipse/site.xml into the **Location** field of the **Add Site** dialog box.
- 5. Click OK.
- 6. Select the Oxygen XML Developer plugin checkbox.
- 7. Click **Next** > and continue with the rest of the installation wizard.
- **8.** Restart Eclipse when prompted.
- Verify that Oxygen XML Developer plugin is installed correctly by creating a new XML Project. Go to File > New >
 Other and choose Oxygen XML Developer plugin > XML Project.
- 10. When prompted for a license key, enter the license information received in the registration email.

Note that if you already have a native version of Oxygen XML Developer plugin installed on your computer, you will not be prompted for a license key for the Eclipse version. The existing license key will be used automatically.

Eclipse Plugin Installation - The Zip Archive Method

The following Eclipse versions are officially supported: 3.6-3.8, 4.2-4.5. The steps for installing the Eclipse plugin with the Zip Archive method are as follows:

- 1. Download the zip archive with the Eclipse plugin.
- 2. Unzip the downloaded zip archive in the dropins subdirectory of the Eclipse install directory.
- 3. Restart Eclipse.
- **4.** Verify that Oxygen XML Developer plugin is installed correctly by creating a new XML Project. Go to **File** > **New** > **Other** and choose **Oxygen XML Developer plugin** > **XML Project**.
- 5. When prompted for a license key, enter the license information received in the registration email.
 - Note that if you already have a native version of Oxygen XML Developer plugin installed on your computer, you will not be prompted for a license key for the Eclipse version. The existing license key will be used automatically.

Install Oxygen XML Developer plugin on Linux

Choosing an Installer

You can install Oxygen XML Developer plugin on Linux using any of the following methods:

- Install using the Update Site method.
- · Install using the Zip archive method.

System Requirements

System requirements for a Linux install:

Site-wide Deployment

If you are deploying Oxygen XML Developer plugin for a group, there are a number of things you can do to customize Oxygen XML Developer plugin for your users and to make the deployment more efficient.

Creating custom default options

You can *create a custom set of default options* for Oxygen XML Developer plugin. These will become the default options for each of your users, replacing Oxygen XML Developer plugin's normal default settings. Users can still set options to suit themselves in their own copies of Oxygen XML Developer plugin, but if they choose to reset their options to defaults, the custom defaults that you set will be used.

Creating default project files

Oxygen XML Developer plugin project files are used to configure a project. You can create and deploy default project files for your projects so that your users will have a preconfigured project file to begin work with.

Shared project files

Rather than each user having their own project file, you can create and deploy shared project files so that all users share the same project configuration and settings and automatically inherit all project changes.

Using floating licenses

If you have a number of people using Oxygen XML Developer plugin on a part-time basis or in different time zones, you can use a *floating license* so that multiple people can share a license.

Obtaining and Registering a License Key for Oxygen XML Developer plugin

Oxygen XML Developer plugin is not free software. To enable and use Oxygen XML Developer plugin, you need a license.

For demonstration and evaluation purposes, a time limited license is available upon request at http://www.oxygenxml.com/register.html. This license is supplied at no cost for a period of 30 days from the date of issue. During this period, the software is fully functional, enabling you to test all its functionality. To continue using the software after the trial period, you must purchase a permanent license. If a trial period greater than 30 days is required, please contact support@oxygenxml.com.

Choosing a License Type

You can use one of the following license types with Oxygen XML Developer plugin:

1. A named-user license may be used by a single *Named User* on one or more computers. Named-user licenses are not transferable to a new *Named User*. If you order multiple named-user licenses, you will receive a single license key good for a specified number of named users. It is your responsibility to keep track of the named users that each license is assigned to.

2. A floating license may be used by any user on any machine. However, the total number of copies of Oxygen XML Developer plugin in use at one time must not be more than the number of floating licenses available. A user who runs two different distributions of Oxygen XML Developer plugin (for example Standalone and Eclipse Plugin) at the same time on the same computer, consumes a single floating license.

For definitions and legal details of the license types, consult the End User License Agreement available at http://www.oxygenxml.com/eula_developer.html.

Obtaining a License

You can obtain a license for Oxygen XML Developer plugin in one of the following ways:

- You can purchase one or more licenses from the Oxygen XML Developer plugin website at http://www.oxygenxml.com/buy.html. A license key will be sent to you by email.
- If your company or organization has purchased licenses please contact your license administrator to obtain a license key.
- If you purchased a subscription and you received a registration code, you can use it to obtain a license key from http://www.oxygenxml.com/registerCode.html. A license key will be sent to you by email.
- If you want to evaluate the product you can obtain a trial license key for 30 days from the Oxygen XML Developer plugin website at http://www.oxygenxml.com/register.html.

Register a Named-User License

To register a named-user license on a machine owned by the *Named User*:

- 1. Save a backup copy of the message containing the new license key.
- 2. Open an XML document in the Oxygen XML Developer plugin. If this is a new install of Oxygen XML Developer plugin, the registration dialog box is displayed. If the registration dialog box is not displayed, go to Window (Eclipse on Mac OSX) and choose Preferences > Oxygen XML Developer plugin and click the Register button.

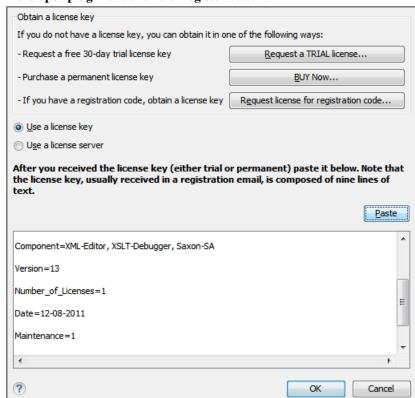

Figure 2: License Registration Dialog Box

- 3. Select Use a license key as licensing method.
- **4.** Paste the license text into the registration dialog box.
- 5. Press OK.

Registering a Floating License

How you register to use a floating license will depend on how floating licenses are managed in your organization.

- If all the machines sharing a pool of floating licenses are on the same network segment, you will register your licence the same way you *register a named-user licence*.
 - Note: [For System Administrators] Different running instances of Oxygen XML Developer plugin communicate with each other, using UDP broadcast on the 59153 port, to the 239.255.255.255 group.
 - **Warning:** This mechanism was deprecated starting with version 17.0 and it is scheduled for removal in a future version. It is recommended to switch to the license server/servlet licensing mechanism.
- If the machines sharing the pool of floating licenses are on different network segments, someone in your company will need to *set up a license server*. Consult that person to determine if they have set up a license server as a standalone process or as a Java servlet as the registration process is different for each.

Request a Floating License from a License Server Running as a Standalone Process

Use this procedure if your company uses a license server running as a standalone process:

- 1. Contact your server administrator to get network address and login details for the license server.
- **2.** Start the Eclipse platform.
- **3.** *Open the Preferences dialog box* and click the **Register** button. The license registration dialog box is displayed.
- **4.** Choose **Use a license server** as licensing method.
- 5. Select **Standalone server** as server type.
- **6.** In the *Host* field enter the host name or IP address of the license server.
- 7. In the *Port* field enter the port number used to communicate with the license server.
- 8. Click the **OK** button.

If a floating license is available, it is registered in Oxygen XML Developer plugin. To display the license details, *open* the **Preferences** dialog box. If a floating license is not available, you will get a message listing the users currently using floating licenses.

Request a Floating License from a License Server Running as a Java Servlet

- 1. Contact your server administrator to get network address and login details for the license server.
- 2. Start the Eclipse platform.
- **3.** *Open the Preferences dialog box* and click the **Register** button. The license registration dialog box is displayed.
- **4.** Choose **Use a license server** as licensing method.
- **5.** Select **HTTP/HTTPS Server** as server type.
- **6.** In the *URL* field enter the address of the license server. The URL address has the following format:
 - http://hostName:port/oXygenLicenseServlet/license-servlet
- 7. Complete the *User* and *Password* fields.
- 8. Click the **OK** button.

If a floating license is available, it is registered in Oxygen XML Developer plugin. To display the license details, *open the Preferences dialog box*. If a floating license is not available, you will get a message listing the users currently using floating licenses.

Release a Floating License

The floating license you are using will be released and returned to the pool if any of the following occur:

- The connection with the license server is lost.
- You exit the application running on your machine, and no other copies of Oxygen XML Developer plugin running on your machine are using your floating license.
- You register a *Named User* license with your copy of Oxygen XML Developer plugin, and no other copies of Oxygen XML Developer plugin running on your machine are using your floating license.

Register a Floating License for Multiple Users

If you are an administrator registering floating licenses for multiple users, you can avoid having to open Oxygen XML Developer plugin on each machine and configuring the registration details by using the following procedure:

- 1. Reset the registration details:
 - a. Select **Register** from the **Help** menu.
 - b. Click OK without entering any information in this dialog box.
 - c. Click **Reset** and restart the application.
- 2. Register the license using one of the *floating license registration procedures*.
- **3.** Copy the license.xml file from the Oxygen XML Developer plugin *preferences directory* to the lib sub-folder of the installation folder on each installation to be registered.

Setting Up a Floating License Server for Oxygen XML Developer plugin

Determine if you need to set up a license server

If you are using floating licenses for Oxygen XML Developer plugin, you may need to set up a license server. If the computers that will be using the floating licenses are on different network segments, you must use an Oxygen XML Developer plugin floating license server. A floating license server can be installed as one of the following:

- A Java servlet.
- A standalone process.

Note: Oxygen XML Developer plugin version 17 or higher requires a license server version 17 or higher. License servers version 17 or higher can be used with any version of a floating license key.

Activating Floating License Keys

To help you comply with the Oxygen XML Developer plugin EULA (terms of licensing), all floating licenses require activation. This means that the license key will be locked to a particular license server deployment and no multiple uses of the same license key are possible.

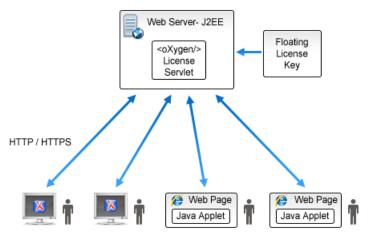

During the activation process, a code that uniquely identifies your license server deployment is sent to the Oxygen XML Developer plugin servers, which in turn will sign the license key.

Split or combine license keys to work with your license servers

A license server can only manage one license key (which can cover any number of floating licenses). If you have multiple license keys for the same Oxygen XML Developer plugin version and you want to have all of them managed by the same server, or if you have a multiple-user floating license and you want to split it between two or more license servers, please contact <code>support@oxygenxml.com</code> and ask for a new license key.

Setting up a Floating License Server Running as a Java Servlet

Setting up the floating license server as a servlet.

<oXygen/> Standalone Installations

<oXygen/> Applets / <oXygen/> Components

Steps for Installing the Floating License Server as a Servlet

- 1. Make sure that Apache Tomcat 5.5 or higher is running on the machine you have selected to be the license server. To get it, go to http://tomcat.apache.org.
- 2. Download the Web ARchive (.war) license servlet from the Oxygen XML Developer plugin website.
- 3. Configure Tomcat to use a security Realm element. Refer to the *Tomcat Documentation* for more information.
- **4.** Edit the tomcat-users.xml file from your Tomcat installation and configure one user for each of the following roles: *standard*, *admin*, and *manager*.
- **5.** Go to the Tomcat Web Application Manager page and log-in with the user you configured with the *manager* role. In the **WAR file to deploy** section, choose the WAR file and click the **Deploy** button. The *oXygen License Servlet* is now up and running, but the license keys are not yet registered.
- **6.** Activate the license key. This process involves binding your license key to your license server deployment. Once the process is completed you cannot activate the license with another license server. Follow these steps to activate the license:
 - **a.** Access the license servlet by following the link provided by the Tomcat Web Application Manager page. If prompted for authentication, use the credentials configured for the *admin* or *manager* users.

Result: A page is displayed that prompts for a license key.

b. Paste your license key into the form and press **Submit**. The browser used in the activation process needs to have Internet access.

Result: You will be redirected to an online form hosted on the Oxygen XML Developer plugin website. This form is pre-filled with an activation code that uniquely identifies your license server deployment, and your license key.

Note: If, for some reason, your browser does not take you to this activation form, refer to the *Manual Activation Procedure*.

c. Press Activate.

If the activation process is successfully completed, your license server is running. Follow the on-screen instructions to configure the Oxygen XML Developer plugin client applications.

7. By default, the license server logs its activity in the

/usr/local/tomcat/logs/oxygenLicenseServlet.log file. To change the log file location, edit the log4j.appender.R2.File property from the

/usr/local/tomcat/we bapps/oXygen License Servlet/WEB-INF/lib/log4j.properties configuration file.

Manual License Activation Procedure

- 1. Access the license servlet by following the link provided by the Tomcat Web Application Manager page. You will be taken to the license registration page.
- 2. Copy the license server activation code.
- **3.** Go to the activation page at http://www.oxygenxml.com/activation/.
- 4. Paste the license server activation code and floating license key in the displayed form, then click Activate.
- **5.** The activated license key is displayed on-screen. Copy the activated license key and paste it in the license registration page of the servlet.

Upgrading Your Floating License Servlet

The goal of the following procedure is to help you minimize the downtime when you upgrade the Oxygen XML Developer plugin floating license servlet to its latest version.

Follow this procedure:

- 1. Access the license servlet by following the link provided by the Tomcat Web Application Manager page. If prompted for authentication, use the *admin* or *manager* credentials.
- 2. Click the View license key link and copy the displayed license key to a file for later use.
- **3.** Go to the Tomcat Web Application Manager page, log in with the user you configured with the *manager* role, and *Undeploy* the floating license servlet.
- **4.** Go to Oxygen XML Developer plugin website and *download the license servlet*.
- 5. Deploy the downloaded license servlet.
- **6.** Access the license servlet by following the link provided by the Tomcat Web Application Manager page. If prompted for authentication, use the credentials configured for the *admin* or *manager* users.
- 7. Paste the license key into the form and register it.

Replacing a Floating License Key in a Floating License Servlet

The following procedure assumes that your Oxygen XML Developer plugin floating license servlet contains a previously *activated license key* and provides instructions for replacing it with another one. The goal of the procedure is to minimize the license servlet downtime during the activation step of the new license key.

This is useful if, for instance, you want to upgrade your existing license to the latest version or if you receive a new license key *that accommodates a different number of users*.

To replace a floating license key that is activated on your floating license servlet with a new one, follow these steps:

- 1. Access the license servlet by following the link provided by the Tomcat Web Application Manager page.
- 2. Click the Replace license key link. This will open a page that contains details about the license currently in use.
- 3. Click the Yes button to begin the replacement procedure.
 - **Note:** During the replacement procedure, new instances of Oxygen XML Developer plugin cannot be licensed by the servlet until the process is completed.
- 4. Paste the new floating license key in the displayed form, then click Submit. The browser used in the process needs to have Internet access.

You will be redirected to an online form hosted on the Oxygen XML Developer plugin website. This form is pre-filled with an activation code that uniquely identifies your license server deployment and your license key.

Note: If for some reason your browser does not take you to this activation form, refer to the *Manual Activation Procedure*.

5. Press Activate.

If the activation process is completed successfully, your license servlet is now running using the new license key. You can click **View license key** to inspect the key currently used by the license servlet.

1

Important: If the activation procedure fails, go to step 1 and click **Cancel** to revert to the last successfully activated license key.

Getting More Information From the Report Page

You can access a license server activity report at

http://hostName:port/oXygenLicenseServlet/license-servlet/report.

It displays the following real time information:

- License load A graphical indicator that shows how many licenses are available. When the indicator turns red, there are no more licenses available.
- **Floating license server status** General information about the license server status, including the following information:
 - server start time
 - · license count
 - · rejected and acknowledged requests
 - · average usage time
 - license refresh and timeout intervals
 - location of the license key
 - · server version
- License key information License key data, including the following information:
 - licensed product
 - · registration name
 - · company name
 - license category
 - number of floating users
 - Maintenance Pack validity
- Current license usage Lists all currently acknowledged users, including the following information:
 - · user name
 - · date and time when the license was granted
 - name and IP address of the computer where Oxygen XML Developer plugin runs
 - MAC address of the computer where Oxygen XML Developer plugin runs

Note: The report is also available in XML format at

http://hostName:port/oXygenLicenseServlet/license-servlet/report-xml.

Setting up a Floating License Server Running as a Standalone Process Using a 32-bit Windows Installer

Setting up the floating license server as a standalone process for Windows.

Steps for Installing the Floating License Server in Windows as a Standalone Process

- 1. Download the license server installation kit for Windows from the Oxygen XML Developer plugin website.
- 2. Run the downloaded installer and follow the on-screen instructions.

By default, the installer installs the license server as a Windows service. Optionally, you have the ability to start the Windows service automatically at Windows startup or create shortcuts on the **Start** menu for starting and stopping the Windows service manually. If you want to manually install, start, stop, or uninstall the server as a Windows service, run the following scripts from a command line as an Administrator:

- installWindowsService.bat [serviceName] Installs the server as a Windows service with the name *serviceName*. The parameters for the license key folder and the server port can be set in the oXygenLicenseServer.vmoptions file.
- startWindowsService.bat [serviceName] Starts the Windows service.
- stopWindowsService.bat [serviceName] Stops the Windows service.
- uninstallWindowsService.bat [serviceName] Uninstalls the Windows service.
- E.

Note: If you do not provide the *serviceName* argument, the default name *oXygenLicenseServer* is used.

If the license server is installed as a Windows service, the output and error messages are automatically redirected to the following log files that are created in the install folder:

- outLicenseServer.log Standard output stream of the server.
- errLicenseServer.log Standard error stream of the server.
- 3. Manually add the oXygenLicenseServer.exe file in the Windows Firewall list of exceptions. Go to Control Panel > System and Security > Windows Firewall > Allow a program or feature through Windows Firewall > Allow another program and browse for oXygenLicenseServer.exe from the Oxygen XML Developer plugin License Server installation folder.
- **4.** Floating licenses require activation prior to use. More details are available either on-screen (if the license server is started in a *command line interface*) or in the outLicenseServer.log log file.

Note: A license server can only manage one license key (which can cover any number of floating licenses). If you have multiple license keys for the same Oxygen XML Developer plugin version and you want to have all of them managed by the same server, or if you have a multiple-user floating license and you want to split it between two or more license servers, please contact <code>support@oxygenxml.com</code> and ask for a new license key.

Upgrading Your Floating License Server

The goal of the following procedure is to help you minimize the downtime generated when you upgrade the Oxygen XML Developer plugin floating license server to its newest version.

Follow this procedure:

1. Go to the Oxygen XML Developer plugin website and download the *latest floating license server*.

- 2. Run the installation kit.
- 3. Leave the default **Update the existing installation** option enabled. This will ensure that some options set in the previous version (namely the installation folder, port number, and the floating license key in use) of the license server will be preserved.
- **4.** Follow the on-screen instructions to complete the installation process.

Replacing a Floating License Key in a Floating License Server

The following procedure assumes that your Oxygen XML Developer plugin floating license server contains a previously *activated license key* and provides instructions for replacing the activated license key with another one. The goal of the procedure is to minimize the license servlet downtime during the activation step of the new license key.

This is useful if, for instance, you want to upgrade your existing license to the latest version or if you receive a new license key *that accommodates a different number of users*.

To replace a floating license key that is activated on your floating license server with a new one, follow these steps:

- 1. Stop the service that runs the floating license server.
- 2. Locate the folder that holds the previous activated license key (by default, it is named license and it is located in the installation directory of the license server).
- 3. Remove the license.txt file and try to restart the server. Since the file that stores the license key is missing, the server will fail to start.
- **4.** Find the license activation procedure in the on-screen instructions (if the license server is started in a *command line interface*) or in the outLicenseServer.log log file.
- 5. After you copy the activated license key in the license.txt file, restart the license server.

Common Problems

This section includes some common problems that may appear when setting up a floating license server running as a standalone process.

Windows Service Reports "Incorrect Function" When Started

The "Incorrect Function" error message when starting the Windows service usually appears because the Windows service launcher cannot locate a Java virtual machine on your system.

Make sure that you have installed a 32-bit Java SE from Oracle (or Sun) on the system: http://www.oracle.com/technetwork/java/javase/downloads/index.html.

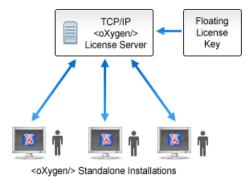

When Started, the Windows Service Reports "Error 1067: The Process Terminated Unexpectedly"

This error message appears if the Windows service launcher quits immediately after being started.

This problem usually happens because the license key has not been correctly deployed (license.txt file in the license folder). For more information, see the *Setting up a Floating License Server section*.

Setting up a Floating License Server Running as a Standalone Process Using a Platform-independent Distribution

This installation method can be used for running the license server on any platform where a Java virtual machine can run (OS X, Linux/Unix, Windows).

Steps for Installing the Floating License Server as a Standalone Process with a Zip Archive

- 1. Ensure that a Java runtime version 6 or later is installed on the server machine.
- 2. Download the license server installation kit for your platform from the Oxygen XML Developer plugin website.
- **3.** Unzip the installation kit into a new folder.
- **4.** Start the server using the startup script from a command line console.

The startup script is called licenseServer.sh for OS X and Unix/Linux or licenseServer.bat for Windows. The following parameters are accepted:

- licenseDir The path of the directory where the license files will be placed. The default value is license.
- port The TCP port number used to communicate with Oxygen XML Developer plugin instances. The default value is 12346.

The following is an example of the command line for starting the license server on Unix/Linux and OS X:

sh licenseServer.sh myLicenseDir 54321

5. Floating licenses require activation prior to use. Follow the on-screen instruction to complete the license activation process.

Upgrading Your Floating License Server

The goal of the following procedure is to help you minimize the downtime generated when you upgrade the Oxygen XML Developer plugin floating license server to its newest version.

Follow this procedure:

- 1. Stop the current license server process.
- 2. Locate and open the floating server startup script. It should look like:

sh licenseServer.sh pathToLicenseDir 54321

- 3. Make a note of the path to the license directory (in our example is pathToLicenseDir) and the port number (in our example is 54321).
- 4. Go to the license directory and copy the license key file (license.txt) for later use.
- 5. Go to the Oxygen XML Developer plugin website and download the *all-platforms floating license server installation*
- **6.** Unzip the archive and overwrite the content of your current floating license server installation.
- 7. Copy the license key file (license.txt) saved in step 4 to license directory of the floating license server installation.
- 8. Edit the floating server startup script and configure with the info you made note of in step 3.
- **9.** Start the floating license server process.

Replacing a Floating License Key in a Floating License Server

The following procedure assumes that your Oxygen XML Developer plugin floating license server contains a previously *activated license key* and provides instructions for replacing the activated license key with another one. The goal of the procedure is to minimize the license servlet downtime during the activation step of the new license key.

This is useful if, for instance, you want to upgrade your existing license to the latest version or if you receive a new license key *that accommodates a different number of users*.

To replace a floating license key that is activated on your floating license server with a new one, follow these steps:

- 1. Stop the process that runs the floating license server.
- 2. Locate the folder that holds the previous activated license key (by default, it is named license and it is located in the installation directory of the license server).
- 3. Remove the license.txt file and try to restart the server. Since the file that stores the license key is missing, the server will fail to start.
- **4.** Find the license activation procedure in the on-screen instructions.
- 5. After you copy the activated license key in the license.txt file, restart the license server.

Transferring or Releasing a License Key

If you want to transfer your Oxygen XML Developer plugin license key to another computer (for example if you are disposing of your old computer or transferring it to another person), or release a *floating license* so that someone else can use it, you must first unregister your license. You can then *register your license* on the new computer in the normal way.

- 1. *Open the Preferences dialog box* and click **Register**. The license registration dialog box is displayed.
- 2. The license key field should be empty (this is normal). If it is not empty, delete any text in the field.
- 3. Make sure the option Use a license key is selected.
- 4. Click OK.
 - A dialog box is displayed asking if your want to reset your license key.
- **5.** Select between falling back to the license key entered previously (for the case of releasing a floating license and reverting to a *Named User* license) and removing your license key from your user account on the computer using the **Reset** button.

The **Reset** button erases all the licensing information. To complete the reset operation, close and restart Oxygen XML Developer plugin.

Upgrading Oxygen XML Developer plugin

From time to time, upgrade and patch versions of Oxygen XML Developer plugin are released to provide enhancements that fix problems, and add new features.

Checking for New Versions of Oxygen XML Developer plugin

Oxygen XML Developer plugin checks for new versions automatically at start up. To disable this check, *open the Preferences dialog box*, go to **Global**, and uncheck **Automatic Version Checking**.

To check for new versions manually, go to **Help** > **Check for New Versions**.

What is Preserved During an Upgrade?

When you install a new version of Oxygen XML Developer plugin, some data is preserved and some is overwritten. If there is a previous version of Oxygen XML Developer plugin already installed on your computer, it can coexist with the new one, which means you do not have to uninstall it.

If you install over a previously installed version:

- All the files from its install directory will be removed, including any modification in *document type (framework) files*, XSLT stylesheets, XML catalogs, and templates.
- All global user preferences are preserved in the new version.
- All project preferences will be preserved in their project files.
- Any custom frameworks that were stored outside the installation directory (as configured in *Document type associations* > *Locations*) will be preserved and will be found by the new installation.

If you install in a new directory.

- All the files from the old install directory will be preserved, including any modification in document type (framework)
 files, XSLT stylesheets, XML catalogs, and templates. However, these modifications will not be automatically
 imported into the new installation.
- All global user preferences are preserved in the new version.
- All project preferences will be preserved in their project files.
- Any custom frameworks that were stored outside the installation directory (as configured in *Document type associations* > *Locations*) will be preserved and will be found by the new installation.

Upgrading the Eclipse Plugin

- 1. Uninstall the current version of Oxygen XML Developer plugin.
- Download and install the new version using the appropriate instructions for your platform and the installation method you chose.
- **3.** Restart the Eclipse platform.
- **4.** Start the Oxygen XML Developer plugin to ensure that the application can start and that your license is recognized by the upgrade installation.
- 5. If you are upgrading from a minor version to a major version (for example, from 16.1 to 17.0) and you did not purchase a Maintenance Pack that covers the new major version (17.0), you will need to enter a new license for the new version (17) into the registration dialog box that is displayed when the plugin is started.

Uninstalling Oxygen XML Developer plugin

Uninstalling the Eclipse plugin

Caution:

The following procedure will remove Oxygen XML Developer plugin from your system. It will not remove the Eclipse platform. If you want to uninstall Eclipse, refer to its uninstall instructions.

- 1. Choose the menu option Help > About > Installation Details.
- **2.** Select Oxygen XML Developer plugin from the list of plugins.
- 3. Choose Uninstall.
- **4.** Accept the Eclipse restart.
- 5. If you also want to remove the user preferences you must remove the folder %APPDATA%\com.oxygenxml.developer on Windows (usually %APPDATA% has the value [user-home-dir]\Application Data)/the subfolder.com.oxygenxml.developer of the user home directory on Linux/the subfolder Library/Preferences/com.oxygenxml.developer of the user home folder on Mac OS X.

Perspectives

Topics:

- <oXygen/> XML Perspective
- XSLT Debugger Perspective
- XQuery Debugger Perspective
- Oxygen XML Developer plugin Database Perspective

The Oxygen XML Developer plugin interface uses standard interface conventions and components to provide a familiar and intuitive editing environment across all operating systems. There are several perspectives that you can use to work with documents in Oxygen XML Developer plugin. You can change the perspective by selecting the perspective from the **Window** > **Open Perspective** menu.

<oXygen/> XML Perspective

The <oXygen/> XML perspective is the most commonly used perspective and it is the default perspective when you start Oxygen XML Developer plugin for the first time. It is the perspective that you will use to edit the content of your XML documents.

To switch the focus to this perspective, select <oXygen/> XML from the Window > Open Perspective menu.

The layout of this perspective is composed of the following components:

Menus

Provides menu driven access to all the features and functions available in Oxygen XML Developer plugin. Most of the menus are common for all types of documents. However, Oxygen XML Developer plugin also includes some context-sensitive and framework-specific menus that are only available for a specific context or type of document.

Toolbars

Provides easy access to common and frequently used functions. Each icon is a button that acts as a shortcut to a related function.

Editor Pane

The main editing pane where you spend most of your time reading, editing, applying markup, and validating your documents.

Views

Oxygen XML Developer plugin includes a large variety of views to assist you with editing, viewing, searching, validating, transforming, and organizing your documents. The most commonly used views are displayed by default and you can choose to display others by selecting them from the Window > Show View menu.

When two or more views are displayed, the application provides divider bars. Divider bars can be dragged to a new position increasing the space occupied by one panel while decreasing it for the other.

As the majority of the work process centers around the Editor area, other views can be hidden using the controls located on the top-right corner of the view (=).

Some of the most helpful views in the <oXygen/> XML perspective include the following:

- Navigator view Enables the definition of projects and logical management of the documents they contain.
- Outline view It provides an XML tag overview and offers a variety of functions, such as modifications follow-up, document structure change, document tag selection, and elements filtering.
- **Results view** Displays the messages generated as a result of user actions such as *validations*, *transformation* scenarios, spell checking in multiple files, search operations, and others. Each message is a link to the location related to the event that triggered the message.
- Attributes view Presents all possible attributes of the current element and allows you to edit attribute values. You can also use this view to insert attributes in **Text** mode.
- Model view Presents the current edited element structure model and additional documentation as defined in the schema.
- **Elements view** Presents a list of all defined elements that you can insert at the current cursor position according to the document's schema.
- Entities view Displays a list with all entities declared in the current document as well as built-in ones.
- Transformation Scenarios view Displays a list with all currently configured transformation scenarios.
- XPath Results view Displays the results from running an XPath expression.
- **Text** view Displays the text output that is produced in XSLT transformations.
- **Browser** view Displays HTML output from XSLT transformations.
- **Problems** view A general Eclipse view that displays system-generated errors, warnings, or information associated with a resource.
- Console view Status information generated by the Schema detection, validation, and transformation threads.
- WSDL SOAP Analyzer view Provides a tool that helps you test if the messages defined in a Web Service Descriptor (WSDL) are accepted by a Web Services server.

Supported Document Types

You can use the main editing pane in the **Editor** perspective to edit a large variety of types of documents. You can see that a document is associated with Oxygen XML Developer plugin by the special icons displayed in the tabs of the editor title bar. The supported document types include:

- Marche XML Schema
- RELAX NG full syntax schemas
- RELAX NG compact syntax schemas

- Schematron documents
- JavaScript documents
- Python documents
- S documents
- LESS documents
- SQL documents
- SON documents
- Ant build scripts

XSLT Debugger Perspective

The XSLT Debugger perspective allows you to detect problems in an XSLT transformation by executing the process step by step. To switch the focus to this perspective, select $\langle oXygen \rangle \rangle$ XSLT Debugger from the Window \rangle Open perspective menu.

The workspace in this perspective is organized as an editing area assisted by special helper views. The editing area contains editor panels that you can *split horizontally or vertically* in a stack of XML editor panels and a stack of XSLT editor panels. The XML files and XSL files can be edited in *Text mode* only.

The layout of this perspective is composed of the following components:

Menus

Provides menu driven access to all the features and functions available in the XSLT Debugger.

Toolbars

Contains all actions needed in order to configure and control the debugging process.

XML Source Pane

The editing pane where you can display and edit data or document-oriented XML documents.

XSL Source Pane

The editing pane where you can display and edit XSL stylesheets.

Output View

Displays the transformed output that results from the input of a selected document (XML) and selected stylesheet (XSL) to the transformer. The result of transformation is dynamically written as the transformation is processed. There are three types of views for the output: a text view (with XML syntax highlight), an XHTML view, and one text view for each xsl:result-document element used in the stylesheet (if it is a XSLT 2.0 / 3.0 stylesheet).

Debugging Information Views

Presented in two panes, they display various types of information that can be used to understand the transformation process. For each information type there is a corresponding tab. While running a transformation, relevant events are displayed in the various information views. This allows you to obtain a clear view of the transformation progress. See the *Debugging Information Views* topic for a list of all the information views (and links to more details on each view).

Note: You are able to add XPath expression automatically in the **XWatch** view using the **Watch expression** action from the contextual menu. In case you select an expression or a fragment of it and then click Watch expression in the contextual menu, the entire selection is presented in the XWatch view. Using Watch **expression** without selecting an expression displays the value of the attribute from the cursor position in the **XWatch** view. Variables detected at the cursor position are also displayed. Expressions displayed in the **XWatch** view are *normalized* (unnecessary white spaces are removed from the expression).

To watch our video demonstration about the XSLT debugging capabilities in Oxygen XML Developer plugin, go to http://www.oxygenxml.com/demo/XSLT_Debugger.html.

XQuery Debugger Perspective

The XQuery Debugger perspective allows you to detect problems in an XQuery transformation process by executing the process step by step in a controlled environment and inspecting the information provided in the special views. To switch the focus to this perspective, select <oXygen/> XQuery Debugger from the Window > Open perspective menu.

The workspace in this perspective is organized as an editing area assisted by special helper views. The editing area contains editor panels that you can split horizontally or vertically in a stack of XML editor panels and a stack of XQuery editor panels. The XML files and XQuery files can be edited in *Text mode* only.

The layout of this perspective is composed of the following components:

Menus

Provides menu driven access to all the features and functions available in the **XQuery Debugger**.

Toolbars

Contains all actions needed in order to configure and control the debugging process.

XML Source Pane

The editing pane where you can display and edit data or document-oriented XML documents.

XQuery Source Pane

The editing pane where you can display and edit XQuery files.

Output View

Displays the transformed output that results from the input of a selected document (XML) and selected XQuery document to the XQuery transformer. The result of transformation is dynamically written as the transformation is processed. There are two types of views for the output: a text view (with XML syntax highlight) and an XHTML view.

Debugging Information Views

Presented in two panes, they display various types of information that can be used to understand the transformation process. For each information type there is a corresponding tab. While running a transformation, relevant events are displayed in the various information views. This allows you to obtain a clear view of the transformation progress. See the *Debugging Information Views* topic for a list of all the information views (and links to more details on each view).

Note: You are able to add XPath expression automatically in the **XWatch** view using the **Watch expression** action from the contextual menu. If you select an expression, or a fragment of it, and then click Watch expression in the contextual menu, the entire selection is presented in the XWatch view. Expressions displayed in the **XWatch** view are normalized (unnecessary white spaces are removed from the expression).

To watch our video demonstration about the XQuery debugging capabilities in Oxygen XML Developer plugin, go to http://www.oxygenxml.com/demo/XQuery_Debugger.html.

Oxygen XML Developer plugin Database Perspective

The Database perspective allows you to manage a database, offering support for browsing multiple connections at the same time, relational and native XML databases, SQL execution, XQuery execution and data export to XML. To switch the focus to this perspective, select <oXygen/> Database from the Window > Open perspective menu.

This perspective offers support for the following databases:

- Oracle Berkeley DB XML Database
- eXist XML Database
- IBM DB2 (Enterprise edition only)
- JDBC-ODBC Bridge
- MarkLogic (Enterprise edition only)
- Microsoft SQL Server 2005 and Microsoft SQL Server 2008 (Enterprise edition only)
- MySQL
- Oracle 11g (Enterprise edition only)
- PostgreSQL 8.3 (Enterprise edition only)
- Documentum xDb (X-Hive/DB) 10 XML Database (Enterprise edition only)
- Documentum (CMS) 6.5 (Enterprise edition only)

Note: For the databases marked with "Enterprise edition only", the XML capabilities are only available in the Enterprise edition of Oxygen XML Developer plugin. The non-XML capabilities of any database listed here are available in the Enterprise, Academic, and Professional editions of Oxygen XML Developer plugin by registering the database driver as a Generic JDBC type driver when defining the data source for accessing the database. For more information, see the Configuring Relational Database Data Sources on page 456 or Configuring Native XML Database Data Sources on page 476 sections.

The supported non-XML capabilities are as follows:

- Browsing the structure of the database instance.
- Opening a database table in the *Table Explorer view*.
- Handling the values from **XML Type** columns as String values.

The supported XML capabilities are as follows:

- Displaying an XML Schema node in the tree of the database structure (for databases with an XML-specific structure) with actions for opening, editing, and validating the schemas in an Oxygen XML Developer plugin editor panel.
- Handling the values from XML Type columns as XML instance documents that can be opened and edited in an Oxygen XML Developer plugin editor panel.
- Validating an XML instance document added to an XML Type (column of a table, etc.)

For a detailed feature matrix that compares the Academic, Professional, and Enterprise editions of Oxygen XML Developer plugin *go to the Oxygen XML Developer plugin website*.

1

Tip: Connections configured on relational data sources can be used to import data to XML or to generate XML schemas.

The layout of this perspective is composed of the following components:

Menus

Provides menu driven access to all the features and functions available in the XQuery Debugger.

Toolbars

Contains all actions needed in order to configure and control the debugging process.

Editor Pane

The main editing pane where you spend most of your time reading, editing, applying markup, and validating your documents.

Data Source Explorer View

Provides browsing support for the configured connections.

Table Explorer View

Provides table content editing support for inserting new rows, deleting table rows, editing cell values, exporting to an XML file, and more.

Editing Modes

Topics:

- Text Editing Mode
- Grid Editing Mode
- Design Editing Mode

The main editing area in Oxygen XML Developer plugin includes several editing modes to suit the type of editing that you want to perform. You can easily switch between modes by clicking on the desired mode at the bottom of the main editing pane. Oxygen XML Developer plugin offers the following editing modes:

- *Text* This mode presents the source of an XML document.
- Grid This mode displays an XML document as a structured grid of nested tables.
- *Design* This mode is found in the schema editor and represents the schema as a diagram.

Text Editing Mode

The **Text** mode of Oxygen XML Developer plugin provides the usual functionality of a plain text editor. It also includes a variety of advanced features that are unique to Oxygen XML Developer plugin.

Text Mode Editor

The **Text** mode **Author** editor in Oxygen XML Developer plugin is designed to be a simple, yet powerful, XML editor. It provides support to help you edit, transform, and debug XML-based documents. It also includes a specialized *Content* Completion Assistant, an Outline view, and many other helpful features.

Navigating the Document Content in Text Mode

Using the Keyboard

Oxygen XML Developer plugin allows you to quickly navigate through a document using the Ctrl Close Bracket (Meta Close Bracket on OS X) key to go to the next XML node and Ctrl Open Bracket (Meta Open Bracket on OS X) to go to the previous one.

To navigate one word forward or backwards, use Ctrl Right Arrow (Command Right Arrow on OS X), and Ctrl **<u>Left Arrow (Command Left Arrow on OS X)</u>**, respectively. To position the cursor at the beginning or end of the document you can use Ctrl Home (Command Home on OS X), and Ctrl End (Command End on OS X), respectively.

Using the Breadcrumb Helpers

A breadcrumb on the top stripe indicates the path from the document root element to the current element. It can also be used as a helpful tool to navigate to specific elements throughout the structure of the document.

article sect1 note para processing-instruction

Figure 3: The Breadcrumb in Text Mode

The last element listed in the *breadcrumb* is the element at the current cursor position. Clicking an element from the breadcrumb selects the entire element in the editor area. Also, each element provides a contextual menu with access to the following actions:

Append Child

Allows you to select an element (from a drop-down list) that is allowed by the associated schema and inserts it as a child of the current element.

Insert Before

Allows you to select an element (from a drop-down list) that is allowed by the associated schema and inserts it immediately before the current element, as a sibling.

Insert After

Allows you to select an element (from a drop-down list) that is allowed by the associated schema and inserts it immediately after the current element, as a sibling.

Edit Attributes

Opens an editing window that allows you to edit the attributes of the currently selected element.

Toggle Comment

Encloses the currently selected element in an XML comment, if the element is not already commented. If it is already commented, this action will remove the comment.

Removes the selected element and copies it to the clipboard.

Copies the selected element to the clipboard.

Delete

Deletes the currently selected element.

Text Mode Views

There is a large selection of useful views available in the **Window** > **Show View** menu. This section presents some of the most helpful views for editing in **Text** mode.

The Navigator View

The **Navigator** view is designed to assist you with organizing and managing related files grouped in the same XML project. The actions available on the contextual menu and toolbar associated to this panel enable the creation of XML projects and shortcuts to various operations on the project documents.

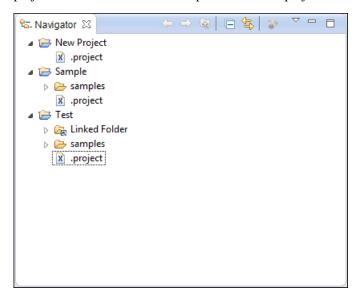

Figure 4: The Navigator View

The following actions are grouped in the upper right corner:

Collapse All

Collapses all project tree folders. You can also collapse/expand a project tree folder if you select it and press the **Enter** key or **Left Arrow** to collapse and **Right Arrow** to expand.

Link with Editor

When selected, the project tree highlights the currently edited file, if it is found in the project files.

Note: This button is disabled automatically when you move to the **Debugger** perspective.

View Menu

Drop-down menu that contains various settings.

The files are usually organized in an XML project as a collection of folders. There are two types of resources displayed in the **Navigator** view:

- Physical folders and files marked with the operating system-specific icon for folders (usually a yellow icon on Windows and a blue icon on Mac OS X). These folders and files are mirrors of real folders or files that exist in the local file system. They are created or added to the project by using contextual menu actions (such as New > File and New > Folder). Also, the contextual menu action
 Delete can be used to remove them from the project and local file system.
- *Shortcut folders and files* the icons for file and folder shortcuts are displayed with a shortcut symbol. They are created and added by using the actions **New** > **File** > **Advanced** or **New** > **Folder** > **Advanced** from the contextual

menu or **File** menu. Also, the contextual menu action **Delete** can be used to remove them from the project (the local file system remains unchanged).

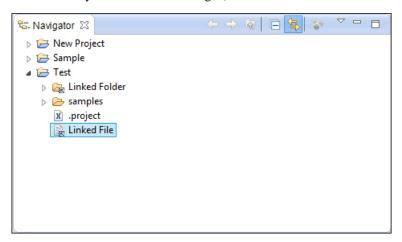

Figure 5: The Navigator View with Examples of the Two Types of Resources

Creating New Projects

The following actions are available by selecting **New** from the contextual menu or **File** menu:

New > XML Project

Opens the **New XML Project** dialog box that allows you to create a new project and adds it to the project structure in the **Navigator** view.

New > Sample XML Project

Opens the **New sample XML project** dialog box that allows you to customize sample resources in a new project and adds it to the project structure in the **Navigator** view.

Creating New Project Items

To create new project items, select the desired document type or folder from the **New** menu of the contextual menu, when invoked from the **Navigator** view (or from the **File** menu). You can also create a document from a template by selecting **New** > **New from Templates** from the contextual menu.

New $> \square$ File

Opens a New file dialog box that helps you create a new file and adds it to the project structure.

New > 퉫 Folder

Opens a **New Folder** dialog box that allows you to specify a name for a new folder and adds it to the structure of the project.

New > Logical Folder

Available when invoked from the *project root*, this action creates a logical folder in the tree structure (the icon is a magenta folder on Mac OS X - (a)).

New > Logical Folders from Web

Available when invoked from the *project root*, this action replicates the structure of a remote folder accessible over FTP/SFTP/WebDAV, as a structure of logical folders. The newly created logical folders contain the file structure of the folder it points to.

Managing Project Content

Creating/Adding Files and Folders

You can create linked folders (shortcuts) by dragging and dropping folders from the Windows Explorer / Mac OS X Finder to the project tree, or by using the contextual menu from the location in the project tree where you wanted it

added and selecting **New** > **Folder** > **Advanced**. To create a file inside a linked folder, use the contextual menu and select **New** > **File** (you can use the **Advanced** button to link to a file in the local file system).

Note: The linked folders presented in the **Navigator** view are marked with a special icon.

You can create physical folders by selecting **New** > **Folder** from the contextual menu.

When adding files to a project, the default target is the project root. To change a target, select a new folder. Files may have multiple instances within the folder system, but cannot appear twice within the same folder.

Removing Files and Folders

To remove one or more files or folders, select them in the project tree and press the **<u>Delete</u>** key, or select the contextual menu action **Delete**.

Caution: In most cases this action is irreversible, deleting the file permanently. Under particular circumstances (if you are running a Windows installation of Oxygen XML Developer plugin and the *Recycle Bin* is active) the file is moved to *Recycle Bin*.

Moving Files and Folders

You can move the resources of the project with drag and drop operations on the files and folders of the tree.

You can also use the usual Copy and Paste actions to move resources in the Navigator view.

Renaming Files and Folders

There are two ways you can *rename an item in the Navigator view*. Select the item in the **Navigator** view and do one of the following:

- Invoke the **Rename** action from the contextual menu.
- Press **<u>F2</u>** and type the new name.

To finish editing the item name, press **Enter**.

Locating and Opening Files

If a project folder contains a lot of documents, a certain document can be located quickly in the project tree by selecting the folder containing the desired document and typing the first few characters of the document name. The desired document is automatically selected as soon as the typed characters uniquely identify its name in the folder.

The selected document can be opened by pressing the **Enter** key, by double-clicking it, or with one of the **Open** actions from the contextual menu. The files with known document types are opened in the associated editor, while binary files are opened with the associated system application. To open a file with a known document type in an editor other than the default one, use the **Open with** action. Also, dragging and dropping files from the project tree to the editor area results in the files being opened.

Saving the Project

The project file is automatically saved every time the content of the **Navigator** view is saved or modified by actions such as adding or removing files and drag and drop.

Validate Files

The currently selected files associated with the Oxygen XML Developer plugin in the **Package Explorer** view or in the **Navigator** view can be checked to be XML well-formed or validated against a schema (DTD, XML Schema, Relax NG, Schematron or NVDL) with one of the following contextual menu actions found in the **Validate** sub-menu:

Validate > Check Well-Formedness

Checks if the selected file or files are well-formed.

Validate Validate

Validates the selected file or files against their associated schema. EPUB files make an exception, because this action triggers a *Validate and Check for Completeness* operation.

ValidateValidate with Schema

Validates the selected file of files against a specified schema.

Validate Configure Validation Scenario(s)

Allows you to configure and run a validation scenario.

Validate > X Clear Validation Markers

Clears all the error markers from the main editor and **Problems** view.

Applying Transformation Scenarios

The currently selected files associated with the Oxygen XML Developer plugin in the **Package Explorer** view or in the **Navigator** view can be transformed in one step with one of the following actions available from contextual menu in the **Transform** sub-menu:

Transform > P Apply Transformation Scenario(s)

Obtains the output with one of the built-in scenarios.

Transform > Configure Transformation Scenario(s)

Opens a dialog box that allows you to configure pre-defined transformation scenarios.

Transform > 🍊 Transform with

Allows you to select a transformation scenario to be applied to the currently selected files.

Refactoring Actions (Available for certain document types (such as XML, XSD, and XSL)

Oxygen XML Developer plugin includes some refactoring operations that help you manage the structure of your documents. The following actions are available from the contextual menu in the **Refactoring** sub-menu:

Refactoring > Rename resource

Allows you to change the name of a resource.

Refactoring > Move resource

Allows you to change the location on disk of a resource.

Refactoring > XML Refactoring

Opens the XML Refactoring tool wizard that presents refactoring operations to assist you with managing the structure of your XML documents.

Other Contextual Menu Actions

Other actions that are available in the contextual menu from the project tree include:

Open

Opens the selected file in the editor.

Open with submenu

This submenu offers you choices for opening the selected file in various editors.

Refresh

Refreshes the content and the dependencies between the resources in the Master Files directory.

//* XPath in Files

Opens the *XPath/XQuery Builder view* that allows you to compose XPath and XQuery expressions and execute them over the currently edited XML document.

Check Spelling in Files

Allows you to check the spelling of multiple files.

Format and Indent Files

Opens the *Format and Indent Files dialog box* that allows you to configure the format and indent (pretty print) action that will be applied on the selected documents.

Properties

Displays the properties of the current file in a **Properties** dialog box.

Outline View

The **Outline** view in **Text** mode displays a general tag overview of the currently edited XML Document. It also shows the correct hierarchical dependencies between elements. This makes it easier for you to be aware of the document structure and the way element tags are nested. It allows for fast navigation of the document by displaying the start of the content of the child elements in the node of the parent element, thus allowing you to quickly see the content of an element without expanding it in the **Outline** tree. It also allows you to insert or delete nodes using contextual menu actions.

By default it is displayed on screen, but if you closed it you can reopen it from Window > Show View > Outline.

The upper part of the view contains a filter box that allows you to focus on the relevant components. If you type a text fragment in the filter box, the components that match it are presented. For advanced usage you can use wildcards (*, ?) and separate multiple patterns with commas.

The Outline view offers the following functionality:

- XML Document Overview on page 54
- Modification Follow-up on page 54
- Drag and Drop Actions in Outline View on page 54
- Outline Filters on page 54
- The Contextual Menu of the Outline View on page 55
- Document Tag Selection on page 56

Figure 6: The Outline View

XML Document Overview

The **Outline** view displays a general tag overview of the current edited XML document. It also shows the correct hierarchical dependencies between the tag elements. This functionality makes it easier for you to be aware of the document structure and the way tags are nested.

The **Outline** view allows you to:

- Insert or delete nodes using contextual menu actions.
- Move elements by dragging them to a new position in the tree structure.
- Highlight elements in the **Author** editor area.

Note: The **Outline** view is synchronized with the **Author** editor area. When you make a selection in the **Author** editor area, the corresponding elements of the selection are highlighted in the **Outline** view and vice versa. This functionality is available both for single and multiple selection. To deselect one of the elements, use **Ctrl Single-Click (Command Single-Click on OS X)**.

Document errors (such as an element inserted in an invalid position, or a wrong attribute name, or a missing required attribute value) are highlighted in the **Outline** tree:

- A red exclamation mark decorates the element icon.
- A dotted red underline decorates the element name and value.
- A tooltip provides more information about the nature of the error, when you hover with the mouse pointer over the faulted element.

Modification Follow-up

When you edit a document, the **Outline** view dynamically follows the changes that you make, displaying the node that you modify in the middle of the view. This functionality gives you great insight on the location of your modifications in the document that you edit.

Drag and Drop Actions in Outline View

Entire XML elements can be moved or copied in the edited document using only the mouse in the **Outline** view with drag-and-drop operations. Several drag and drop actions are possible:

- If you drag an XML element in the **Outline** view and drop it on another one in the same panel then the dragged element will be moved after the drop target element.
- If you hold the mouse pointer over the drop target for a short time before the drop then the drop target element will be expanded first and the dragged element will be moved inside the drop target element after its opening tag.
- You can also drop an element before or after another element if you hold the mouse pointer towards the upper or lower part of the targeted element. A marker will indicate whether the drop will be performed before or after the target element.
- If you hold down the (Ctrl (Command on OS X)) key after dragging, there will be performed a copy operation instead of a move one.

The drag and drop action in the **Outline** view can be disabled and enabled from a Preferences page.

Outline Filters

The upper part of the **Outline** view contains a filter box that allows you to focus on the relevant components. Type a text fragment in the filter box and only the components that match it are presented. For advanced usage you can use wildcard characters (*, ?) and separate multiple patterns with commas.

The following actions are available in the **View menu** of the **Outline** view when editing in **Text** mode:

Filter returns exact matches

The text filter of the **Outline** view returns only exact matches.

Selection update on cursor move

Controls the synchronization between **Outline** view and source document. The selection in the **Outline** view can be synchronized with the cursor moves or the changes in the editor. Selecting one of the components from the **Outline** view also selects the corresponding item in the source document.

Flat presentation mode of the filtered results

When active, the application flattens the filtered result elements to a single level.

Show comments and processing instructions

Show/hide comments and processing instructions in the Outline view.

Show element name

Show/hide element name.

T Show text

Show/hide additional text content for the displayed elements.

Show attributes

Show/hide attribute values for the displayed elements. The displayed attribute values can be changed from *the Outline preferences panel*.

Configure displayed attributes

Displays the XML Structured Outline preferences page.

The Contextual Menu of the Outline View

The following actions are available from the contextual menu in the **Outline** view in **Text** mode:

Append Child

Allows you to select an element (from a drop-down list) that is allowed by the associated schema and inserts it as a child of the current element.

Insert Before

Allows you to select an element (from a drop-down list) that is allowed by the associated schema and inserts it immediately before the current element, as a sibling.

Insert After

Allows you to select an element (from a drop-down list) that is allowed by the associated schema and inserts it immediately after the current element, as a sibling.

Edit Attributes

Opens a dialog box that allows you to edit the attributes of the currently selected component.

→! Toggle Comment

Encloses the currently selected element in an XML comment, if the element is not already commented. If it is already commented, this action will remove the comment.

& Cut

Cuts the currently selected component.

녵 Сору

Copies the currently selected component.

X Delete

Deletes the currently selected component.

Expand All

Expands the structure of a component in the **Outline** view.

Collapses the structure of all the component in the **Outline** view.

Document Tag Selection

The Outline view can also be used to search for a specific tag location and contents in the edited document. Intuitively, by selecting with the left mouse button the desired tag in the Outline view, the document is scrolled to the position of the selected tag. Moreover, the tag contents are selected in the document, making it easy to notice the part of the document contained by that specific tag and furthermore to easily copy and paste the tag's contents in other parts of the document or in other documents.

You can double click the tag in the **Outline** tree to move the focus in the editor.

You can also use the filter text field search to look for a particular tag name in the **Outline** tree.

The Attributes View

The Attributes view presents all the attributes of the current element determined by the schema of the document.

You can use the **Attributes** view to insert attributes, edit their values, or add values to existing attributes.

The attributes are rendered differently depending on their state:

- The names of the attributes with a specified value are rendered with a bold font, and their value with a plain font.
 - Note: The names of the attributes with an empty string value are also rendered bold.
- Default values are rendered with a plain font, painted gray.
- Empty values display the text "[empty]", painted gray.
- Invalid attributes and values are painted red.

Double-click a cell in the **Value** column to edit the value of the corresponding attribute. If the possible values of the attribute are specified as list in the schema of the edited document, the **Value** column acts as a combo box that allows you to insert the values in the document.

You can sort the attributes table by clicking the Attribute column header. The table contents can be sorted as follows:

- · By attribute name in ascending order.
- By attribute name in descending order.
- Custom order, where the used attributes are displayed at the beginning of the table sorted in ascending order, followed
 by the rest of the allowed elements sorted in ascending order.

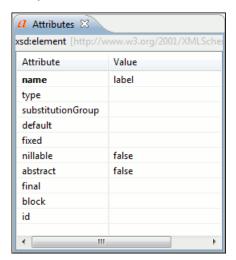

Figure 7: The Attributes View

Contextual Menu Actions in the Attributes View

The following actions are available in the contextual menu of the Attributes view when editing in Text mode:

Add

Allows you to insert a new attribute.

Set empty value

Specifies the current attribute value as empty.

Remove

Removes the attribute (action available only if the attribute is specified). You can invoke this action by pressing the **(Delete)** or **(Backspace)** keys.

Copy

Copies the attrName="attrValue" pair to the clipboard. The attrValue can be:

- The value of the attribute.
- The value of the default attribute, if the attribute does not appear in the edited document.
- Empty, if the attribute does not appear in the edited document and has no default value set.

Paste

Depending on the content of the clipboard, the following cases are possible:

- If the clipboard contains an attribute and its value, both of them are introduced in the **Attributes** view. The attribute is selected and its value is changed if they exist in the **Attributes** view.
- If the clipboard contains an attribute name with an empty value, the attribute is introduced in the Attributes
 view and you can start editing it. The attribute is selected and you can start editing it if it exists in the Attributes
 view.
- If the clipboard only contains text, the value of the selected attribute is modified.

The Model View

The **Model** view presents the structure of the currently selected tag, and its documentation, defined as annotation in the schema of the current document. To open the **Model** view, select it from the **Window** > **Show View** > **Other** > **Oxygen XML Developer plugin** menu.

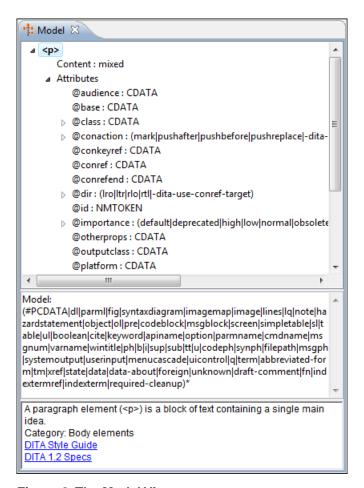

Figure 8: The Model View

The **Model** view is comprised of two sections, an element structure panel and an annotations panel.

Element Structure Panel

The element structure panel displays the structure of the currently edited or selected tag in a tree-like format. The information includes the name, model, and attributes of the current tag. The allowed attributes are shown along with imposed restrictions, if any.

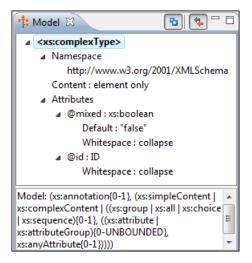

Figure 9: The Element Structure Panel

Annotation Panel

The **Annotation** panel displays the annotation information for the currently selected element. This information is collected from the XML schema.

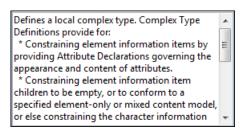

Figure 10: The Annotation panel

The Elements View

The **Elements** view presents a list of all defined elements that you can insert at the current cursor position according to the schema associated to the document. Double-clicking any of the listed elements inserts that element in the edited document. All elements from a sequence are presented but the invalid proposals (which cannot be inserted in the current context) are disabled and rendered in gray.

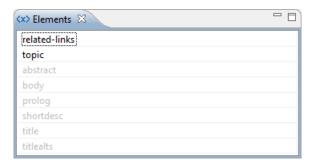

Figure 11: The Elements View

The Entities View

This view displays a list with all entities declared in the current document, as well as built-in ones. Double-clicking one of the entities will insert it at the current cursor position. You can also sort entities by name and value by clicking the column headers.

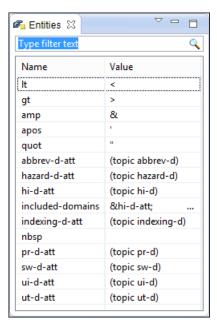

Figure 12: The Entities View

The view features a filtering capability that allows you to search an entity by name, value, or both. Also, you can choose to display the internal or external entities.

Note: When entering filters, you can use the ? and * wildcards. Also, you can enter multiple filters by separating them with a comma.

The Results View

The **Results View** displays the messages generated as a result of user actions such as validations, transformations, search operations, and others. Each message is a link to the location related to the event that triggered the message. Double-clicking a message opens the file containing the location and positions the cursor at the location offset. The actions that can generate result messages include the following:

- Validate action
- Transform action
- Check Spelling in Files action
- .
- Search References action
- SQL results

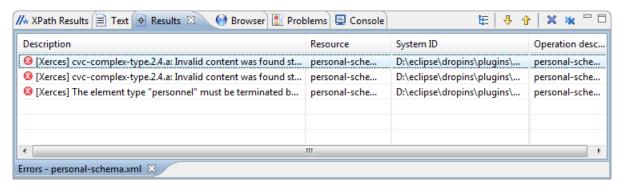

Figure 13: Results View

Results View Toolbar Actions

The view includes a toolbar with the following actions:

Grouping Mode toggle options

You can choose to group the result messages in a Hierarchical or Flat arrangement.

Next

Navigates to the message below the current selection.

1 Previous

Navigates to the message above the current selection.

X Remove selected

Removes the current selection from the view. This can be helpful if you want to reduce the number of messages or remove those that have already been addressed or not relevant to your task.

Remove all

Removes all messages from the view.

Results View Contextual Menu Actions

The following actions are available when the contextual menu is invoked in the table grid:

Show message

Displays a dialog box with the full error message, which is useful for a long message that does not have enough room to be displayed completely in the view.

Remove

Removes selected messages from the view.

Remove all

Removes all messages from the view.

Copy

Copies the information associated with the selected messages:

- The file path of the document that triggered the output message.
- Error severity (error, warning, info message, etc.)
- Name of validating processor.
- The line and column in the file that triggered the message.

Save Results

Saves the complete list of messages in a file in text format. For each message the included details are the same as the ones for *the Copy action*.

Save Results as XML

Saves the complete list of messages in a file in XML format. For each message the included details are the same as the ones for *the Copy action*.

Expand All

Available when **Hierarchical** mode is selected. Expands all the nodes of the tree, which is useful when the messages are presented in a hierarchical mode.

Collapse All

Available when **Hierarchical** mode is selected. Collapses all the nodes of the tree, which is useful when the messages are presented in a hierarchical mode.

Syntax Highlight Depending on Namespace Prefix

The *syntax highlight scheme of an XML file type* allows the configuration of a color per each type of token that can appear in an XML file. Distinguishing between the XML tag tokens based on the namespace prefix brings additional visual help in editing some XML file types. For example, in XSLT stylesheets, elements from different namespaces

(such as XSLT, XHTML, XSL:FO, or XForms) are inserted in the same document and the editor panel can become cluttered. *Marking tags with different colors based on the namespace prefix* allows easier identification of the tags.

Figure 14: Example of Coloring XML Tags by Prefix

Presenting Validation Errors in Text Mode

A line with a validation error or warning will be marked in the editor panel by underlining the error region with a red color. Also a red sign will mark the position in the document of that line on the right side ruler of the editor panel. The same will happen for a validation warning, but the color will be yellow instead of red. Hovering over a validation error presents a tooltip message with more details about the error and *possible quick fixes* (if available for that error or warning).

The ruler on the right side of the document is designed to display the errors and warnings found during the validation process and also to help you to locate them more easily. The ruler contains the following areas:

- Top area that contains a success validation indicator that will turn green if the validation succeeded, or red otherwise.
- Middle area where the error markers are depicted in red. To limit the number of markers shown open the Preferences
 dialog box and go to Editor > Document checking > Maximum number of problems reported per document.

Clicking a marker will highlight the corresponding text area in the editor. The error message is displayed both in the tool tip and in the error area on the bottom of the editor panel.

Status messages from every validation action are logged into the *Console view*.

If you want to see all the validation error messages *grouped in a view* you should use the **Validate** action from the **XML** menu or from the **Validation** toolbar drop-down menu. This action collects all error messages in the **Problems** view of the Eclipse platform if the validated file is in the current workspace or in a custom **Errors** view if the validated file is outside the workspace.

Grid Editing Mode

The **Grid** editing mode in Oxygen XML Developer plugin displays XML documents in a structured spreadsheet-like grid. It allows you to easily edit XML documents consisting of repetitive patterns.

Grid Mode Editor

The Oxygen XML Developer plugin **Grid** editor displays the XML document as a structured grid of nested tables. To activate this mode, select **Grid** at the bottom of the editing area.

If you are a non-technical user, you are able to modify the text content of the edited document without working with the XML tags directly. You can expand and collapse the tables using the mouse cursor and also display or hide the elements of the document as nested. The document structure can also be changed easily with drag and drop operations on the grid components. To zoom in and out, use Ctrl+[plus sign] (Command + [plus sign] on OS X), Ctrl O (Command 0 on OS X)) or Ctrl Scroll Forward (Command Scroll Backwards on OS X).

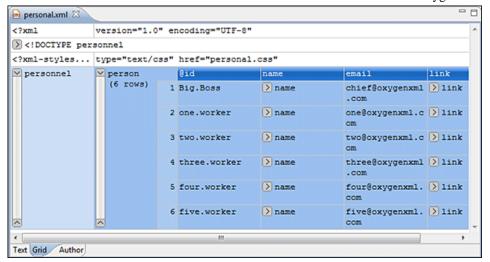

Figure 15: The Grid Editor

To switch back from the **Grid** mode to the **Text** or **Author** mode, use the **Text** and **Grid** buttons from the bottom of the editor.

If the edited document is associated with a schema (DTD, XML Schema, Relax NG, etc.), the editor offers **Content Completion Assistant** for the elements and attributes names and values. If you choose to insert an element that has required content, the sub-tree of needed elements and attributes are automatically included.

To display the content completion pop-up menu, you have to start editing (for example, double click a cell). Pressing **Ctrl Space (Command Space on OS X)** on your keyboard also displays the pop-up menu.

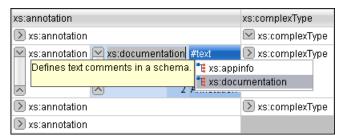

Figure 16: Content Completion in Grid Editor

To watch our video demonstration about some of the features available in the **Grid** editor, go to http://oxygenxml.com/demo/Grid_Editor.html.

Layouts: Grid and Tree

The **Grid** editor offers two layout modes. The default one is the grid layout. This smart layout detects the recurring elements in the XML document and creates tables having the children (including the attributes) of these elements as columns. This way, it is possible to have tables nested in other tables, reflecting the structure of your document.

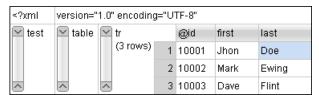

Figure 17: Grid Layout

The other layout mode is tree-like. It does not create any tables and it only presents the structure of the document.

Figure 18: Tree Layout

To switch between the two modes, go to the contextual menu > Grid mode/Tree mode.

Grid Mode Navigation

At first, the content of a document opened in the **Grid** mode is collapsed. Only the root element and its attributes are displayed. The grid disposition of the node names and values is similar to a web form or dialog box. The same set of key shortcuts used to select dialog box components is also available in the **Grid** mode:

Table 1: Shortcuts in the Grid Mode

Key	Action		
<u>Tab</u>	Moves the cursor to the next editable value in a table row.		
Shift Tab	Moves the cursor to the previous editable value in a table row.		
Enter	Begins editing and lets you insert a new value. Also commits the changes after you finish editing.		
Up Arrow/Page Up	Navigates toward the beginning of the document.		
Down Arrow/Page Down	Navigates toward the end of the document.		
Shift	Used in conjunction with the navigation keys to create a continuous selection area.		
Ctrl (Command on OS X) key	Used in conjunction with the mouse cursor to create discontinuous selection areas.		

The following key combinations can be used to scroll the grid:

- Ctrl Up Arrow (Command Up Arrow on OS X) scrolls the grid upwards.
- Ctrl Down Arrow (Command Down Arrow on OS X) scrolls the grid downwards.
- Ctrl Left Arrow (Command Left Arrow on OS X) scrolls the grid to the left.
- Ctrl Right Arrow (Command Right Arrow on OS X) scrolls the grid to the right.

An arrow sign displayed at the left of the node name indicates that this node has child nodes. To display the children, click this sign. The expand/collapse actions can be invoked either with the **NumPad+** and **NumPad-** keys, or from the **Expand/Collapse** submenu of the contextual menu.

The following actions are available on the **Expand/Collapse** menu:

Expand All

Expands the selection and all its children.

Collapse All

Collapses the selection and all its children.

Expand Children

Expands all the children of the selection but not the selection.

Collapse Children

Collapses all the children of the selection but not the selection.

Collapse Others

Collapses all the siblings of the current selection but not the selection.

Bidirectional Text Support in Grid Mode

If you are editing documents employing a different text orientation, you can change the way the text is rendered and edited in the grid cells by using the **Change Text Orientation**(**Ctrl Shift O (Meta Shift O on OS X)**) action that is available from the **Edit** menu in the **Grid** editing mode. Use this action to switch from the default left to right text orientation to the right to left orientation, and vice versa.

Note: This change applies only to the text from the cells, and not to the layout of the grid editor.

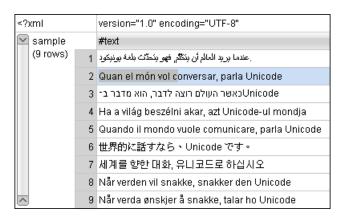

Figure 19: Default left to right text orientation

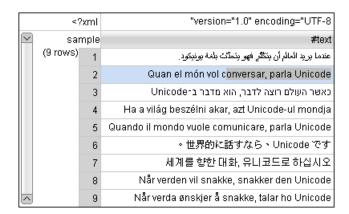

Figure 20: Right to left text orientation

Design Editing Mode

This section presents the **Design** mode that allows you to edit XML Schemas in a visual schema diagram editor.

XML Schemas enable document designers to specify the allowed structure and content of an XML document and to check if an XML document is valid.

Oxygen XML Developer plugin provides a simple and expressive XML Schema diagram editor (**Design** mode) for editing XML Schemas. The schema diagram helps both the content authors who want to understand a schema and schema designers who develop complex schemas.

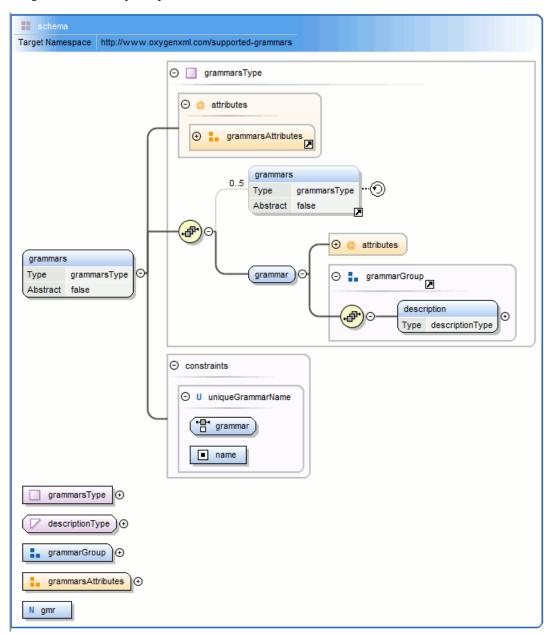

Figure 21: XML Schema Diagram

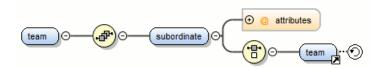

To watch our video demonstration about the basic aspects of designing an XML Schema using the new Schema Editor, go to http://oxygenxml.com/demo/XML_Schema_Editing.html.

Navigation in the Schema Diagram

The following editing and navigation features work for all types of schema components:

• Move/reference components in the diagram using drag-and-drop actions.

- Select consecutive components on the diagram (components from the same level) using the *Shift* key. You can also make discontinuous selections in the schema diagram using the Ctrl (Meta on Mac OS) key. To deselect one of the components, use Ctrl Single-Click (Command Single-Click on OS X).
- Use the arrow keys to navigate the diagram vertically and horizontally.
- Use *Home/End* keys to jumpt to the first/last component from the same level. Use **Ctrl Home (Command Home on OS X)** key combination to go to the diagram root and **Ctrl End (Command End on OS X)** to go to the last child of the selected component.
- You can easily go back to a previously visited component while moving from left to right. The path will be preserved only if you use the left arrow key or right arrow key. For example, if the current selection is on the second attribute from an attribute group and you press the left arrow key to jump to the attribute group, when you press the right arrow key, then the selection will be moved to the second attribute.
- Go back and forward between components viewed or edited in the diagram by selecting them in the **Outline** view:
 - Back (go to previous schema component).
 - **Forward** (go to next schema component).
 - Go to Last Modification (go to last modified schema component).
- Copy, reference, or move global components, attributes, and identity constraints to a different position and from one schema to another using the **Cut/Copy** and **Paste/Paste as Reference** actions.
- Go to the definition of an element or attribute with the **Show Definition** action.
- You can expand and see the contents of the imports/includes/redefines in the diagram. In order to edit components from other schemas the schema for each component will be opened as a separate file in Oxygen XML Developer plugin.
 - Tip: If an XML Schema referenced by the current opened schema was modified on disk, the change will be detected and you will be asked to refresh the current schema contents.
- Recursive references are marked with a *recurse symbol*: Click this symbol to navigate between the element declaration and its reference.

XML Schema Outline View

The **Outline** view for XML Schema presents all the global components grouped by their location, namespace, or type. If hidden, you can open it from **Window** > **Show View** > **Outline**.

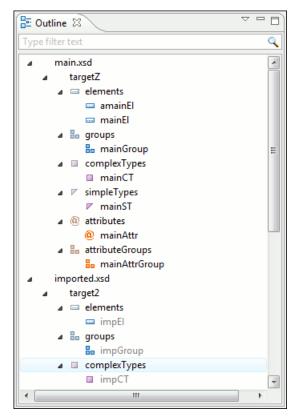

Figure 22: The Outline View for XML Schema

The **Outline** view provides the following options in the **View Menu** on the **Outline** view action bar:

Filter returns exact matches

The text filter of the **Outline** view returns only exact matches;

Selection update on cursor move

Allows a synchronization between **Outline** view and schema diagram. The selected view from the diagram is also selected in the **Outline** view.

♣ Sort

Allows you to sort alphabetically the schema components.

Show all components

Displays all components that were collected starting from the main files. Components that are not referable from the current file are marked with an orange underline. To reference them, add an import directive with the componentNS namespace.

Show referable components

Displays all components (collected starting from the main files) that can be referenced from the current file. This option is set by default.

Show only local components

Displays the components defined in the current file only.

Group by location/namespace/type

These three operations allow you to group the components by location, namespace, or type. When grouping by namespace, the main schema target namespace is the first presented in the **Outline** view.

The following contextual menu actions are available in the **Outline** view:

Remove (Delete)

Removes the selected item from the diagram.

Search References

Searches all references of the item found at current cursor position in the defined scope, if any.

Search References in

Searches all references of the item found at current cursor position in the specified scope.

Component Dependencies

Allows you to see the dependencies for the current selected component.

Resource Hierarchy

Allows you to see the hierarchy for the current selected resource.

Resource Dependencies

Allows you to see the dependencies for the current selected resource.

Rename Component in

Renames the selected component.

Generate Sample XML Files

Generate XML files using the current opened schema. The selected component is the XML document root.

The upper part of the **Outline** view contains a filter box that allows you to focus on the relevant components. Type a text fragment in the filter box and only the components that match it are presented. For advanced usage you can use wildcard characters (*, ?) and separate multiple patterns with commas.

Tip: The search filter is case insensitive. The following wildcards are accepted:

- * any string
- ? any character
- , patterns separator

If no wildcards are specified, the string to search will be searched as a partial match (like *textToFind*).

The content of the **Outline** view and the editing area are synchronized. When you select a component in the **Outline** view, its definition is highlighted in the editing area.

The Attributes View

The **Attributes** view presents the properties for the selected component in the schema diagram. If hidden, you can open it from **Window** > **Show View** > **Other** > **Oxygen XML Developer plugin** > **Attributes**.

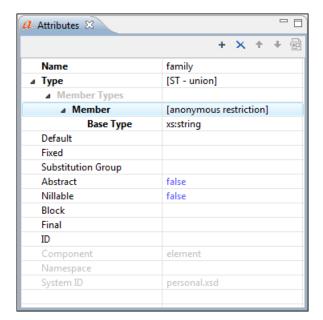

Figure 23: The Attributes View

The default value of a property is presented in the **Attributes** view with blue foreground. The properties that can not be edited are rendered with gray foreground. A non-editable category which contains at least one child is rendered with bold. Bold properties are properties with values set explicitly to them.

Properties for components which do not belong to the current edited schema are read-only but if you double-click them you can choose to open the corresponding schema and edit them.

You can edit a property by double-clicking by pressing Enter. For most properties you can choose valid values from a list or you can specify another value. If a property has an invalid value or a warning, it will be highlighted in the table with the corresponding foreground color. By default properties with errors are highlighted with red and the properties with warnings are highlighted with yellow. You can customize these colors from the *Document checking user preferences*.

For imports, includes and redefines, the properties are not edited directly in the **Attributes** view. A dialog box will open that allows you to specify properties for them.

The schema namespace mappings are not presented in **Attributes** view. You can view/edit these by choosing **Edit Schema Namespaces** from the contextual menu on the schema root. See more in the *Edit Schema Namespaces* section.

The Attributes view has five actions available on the toolbar and also on the contextual menu:

+ Add

Allows you to add a new member type to an union's member types category.

× Remove

Allows you to remove the value of a property.

1 Move Up

Allows you to move up the current member to an union's member types category.

Move Down

Allows you to move down the current member to an union's member types category.

Copy

Copy the attribute value.

Show DefinitionCtrl (Meta on MAC OS) + Click

Shows the definition for the selected type.

Show Facets

Allows you to edit the facets for a simple type.

The Facets View

The **Facets** view presents the facets for the selected component, if available. If hidden, you can open it from **Window** > **Show View** > **Other** > **Oxygen XML Developer plugin** > **Facets**.

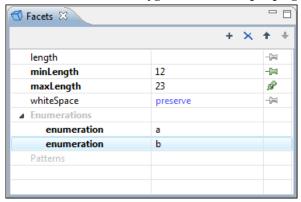

Figure 24: The Facets View

The default value of a facet is rendered in the **Facets** view with a blue color. The facets that can not be edited are rendered with a gray color. The grouping categories (for example: **Enumerations** and **Patterns**) are not editable. If these categories contain at least one child they are rendered with bold. Bold facets are facets with values set explicitly to them.

Important: Usually inherited facets are presented as default in the **Facets** view but if patterns are inherited from a base type and also specified in the current simple type only the current specified patterns will be presented. You can see the effective pattern value obtained by combining the inherited and the specified patterns as a tooltip on the **Patterns** category.

Facets for components which do not belong to the current edited schema are read-only but if you double-click them you can choose to open the corresponding schema and edit them.

You can edit a facet by double-clicking it or by pressing Enter, when that facet is selected. For some facets you can choose valid values from a list or you can specify another value. If a facet has an invalid value or a warning, it will be highlighted in the table with the corresponding foreground color. By default facets with errors are presented with red and the facets with warnings with yellow. You can customize the error colors from the *Document Checking user preferences*.

The **Facets** view provides the following actions in its toolbar and contextual menu:

+ Add

Allows you to add a new enumeration or a new pattern.

× Remove

Allows you to remove the value of a facet.

Edit Annotations

Allows you to edit an annotation for the selected facet.

1 Move Up

Allows you to move up the current enumeration/pattern in **Enumerations/Patterns** category.

Move Down

Allows you to move down the current enumeration/pattern in Enumerations/Patterns category.

Copy the attribute value.

Open in Regular Expressions Builder

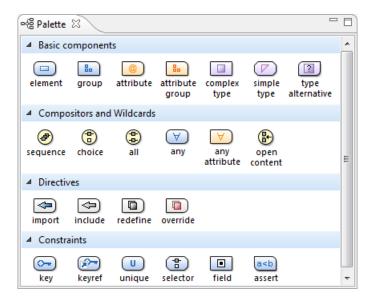

Rather than editing regular expressions manually, this action allows you to open the pattern in the *XML Schema Regular Expressions Builder* that guides you through the process of testing and constructing the pattern..

Facets can be fixed to prevent a derivation from modifying its value. To fix a facet value just press the 🝽 **Pin** button.

The Palette View

The **Palette** view is designed to offer quick access to XML Schema components and to improve the usability of the XML Schema diagram builder. You can use the **Palette** to drag and drop components in the **Design** mode. The components offered in the **Palette** view depend on the XML schema version set in the **XML Schema** preferences page.

Figure 25: Palette View

Components are organized functionally into 4 collapsible categories:

- Basic components: elements, group, attribute, attribute group, complex type, simple type, type alternative.
- Compositors and Wildcards: sequence, choice, all, any, any attribute, open content.
- Directives: import, include, redefine, override.
- Identity constraints: key, keyref, unique, selector, field, assert.

Note: The *type alternative*, *open content*, *override*, and *assert* components are available for XML Schema 1.1.

To add a component to the edited schema:

- Click and hold a graphic symbol from the **Palette** view, then drag the component into the **Design** view.
- A line dynamically connects the component with the XML schema structure.
- Release the component into a valid position.

To watch our video demonstration about the Schema palette and developing XML Schemas, go to http://oxygenxml.com/demo/Schema_Palette.html and http://oxygenxml.com/demo/Developing_XML_Schemas.html respectively.

This chapter explains the editor types available in Oxygen XML Developer plugin and how to work with them for editing different types of documents.

Working with Unicode

Unicode provides a unique number for every character, independent of the platform and language. Unicode is an internationally recognized standard, adopted by industry leaders. The Unicode is required by modern standards (such as XML, Java, JavaScript, LDAP, CORBA 3.0, WML, etc.) and is the official way to implement ISO/IEC 10646.

It is supported in many operating systems, all modern browsers, and many other products. The emergence of the Unicode Standard, and the availability of tools supporting it, are among the most significant recent global software technology trends. Incorporating Unicode into client-server or multiple tiered applications and websites offers significant cost savings over the use of legacy character sets.

As a modern XML Editor, Oxygen XML Developer plugin provides support for the Unicode standard enabling your XML application to be targeted across multiple platforms, languages, and countries without re-engineering. Internally, the Oxygen XML Developer plugin XML Editor uses 16 bit characters covering the Unicode Character set.

Note: Oxygen XML Developer plugin may not be able to display characters that are not supported by the operating system (either not installed or unavailable).

Tip: On windows, you can enable the support for CJK (Chinese, Japanese, Korean) languages from Control Panel / Regional and Language Options / Languages / Install files for East Asian languages.

Opening and Saving Unicode Documents

When loading documents, Oxygen XML Developer plugin receives the encoding of the document from the Eclipse platform. This encoding is then used to instruct the Java Encoder to load support for and to save the document using the specified code chart.

While in most cases you are using UTF-8, simply changing the encoding name causes the application to save the file using the new encoding.

To edit documents written in Japanese or Chinese, change the font to one that supports the specific characters (a Unicode font). For the Windows platform, Arial Unicode MS or MS Gothic is recommended. Do not expect WordPad or Notepad to handle these encodings. Use Internet Explorer or Word to examine XML documents.

When a document with a UTF-16 encoding is edited and saved in Oxygen XML Developer plugin, the saved document has a byte order mark (BOM) which specifies the byte order of the document content. The default byte order is platform-dependent. That means that a UTF-16 document created on a Windows platform (where the default byte order mark is UnicodeLittle) has a different BOM than a UTF-16 document created on a Mac OS platform (where the byte order mark is *UnicodeBig*). The byte order and the BOM of an existing document are preserved when the document is edited and saved.

Inserting Symbols

You can insert symbols by using the **Character Map** dialog box that can be opened with the **Edit** $> \Omega$ **Insert from** Character Map action.

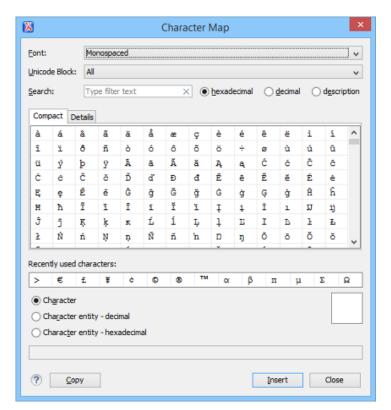

Figure 26: The Character Map Dialog Box

The **Character Map** dialog box allows you to visualize all characters that are available in a particular font, pick the character you need, and insert it in the document you are editing. It includes the following fields and sections:

Font

Use this drop-down list to choose the font for which you want to display characters.

Unicode Block

Use this drop-down list to only see a certain range of characters. This will filter the number of characters displayed, showing only a contiguous range of characters corresponding to the selected block. Unassigned characters are displayed as empty squares.

Search

Use this filter to search for a character by one of the following attributes:

- hexadecimal
- decimal
- description

Note: Selecting the **description** option opens the **Details** tab. If you enter a character description in the **Search** field, the **description** option is selected automatically.

Character Table Section

The characters that are available to be inserted are listed in two tabs:

- Compact Matrix-like table that displays a visual representation of the characters.
- **Details** Displays the available characters in a tabular format, presenting their decimal and hexadecimal value along with their description.

Recently Used Characters Section

Displays the symbols that you have used recently and you can also select one from there to insert it in the current document.

Character Mode Section

The next section of the dialog box allows you to select how you want the character to appear in your document. You can choose between the following:

- Character
- · Character entity decimal
- · Character entity hexadecimal

You can see the character or code that will be inserted in your document next to the selections in this section. You can also see the name and range name of a character either at the bottom of the dialog box, or in a tooltip when hovering the cursor over the character.

Press the **Insert** button to insert the selected character in the current editor at cursor position. You will see the character in the editor if *the editor font* is able to render it. The **Copy** button copies it to the clipboard without inserting it in the editor.

Note: The **Character Map** dialog box is not available in *the Grid editor*.

Unicode Fallback Font Support

Oxygen XML Developer plugin provides fonts for most common Unicode ranges. However, if you use special symbols or characters that are not included in the default fonts, they will be rendered as small rectangles. A *fallback* font is a reserve typeface that contains symbols for as many Unicode characters as possible. When a display system encounters a character that is not part of the range of any of the available fonts, Oxygen XML Developer plugin will try to find that symbol in a *fallback* font.

Example of a Scenario Where a Fallback Font is Needed

Suppose that you need to insert the Wheelchair symbol (-U+267F) into your content in a Windows operating system. By default, Oxygen XML Developer plugin does not render this symbol correctly since it is not included in any of the default fonts. It is included in *Segoe UI Symbol*, but this font is not part of the default fonts that come with Oxygen XML Developer plugin. To allow Oxygen XML Developer plugin to recognize and render the symbol correctly, you can add *Segoe UI Symbol* as a *fallback* font.

Add a Fallback Font in Windows (7 or Later)

To add a fallback font to the Oxygen XML Developer plugin installation, use the following procedure:

- 1. Start Windows Explorer and browse to the [OXYGEN_INSTALLATION_DIR]/jre/lib/fonts directory.
- 2. Create a directory called fallback (if it is not already there).
- 3. Copy a font file (True Type Font TTF) that includes the special characters into this directory.
 - Tip: You could, for example, copy the Segoe UI Symbol Regular font from C:\Windows\Fonts.
- 4. Restart Oxygen XML Developer plugin for the changes to take full effect.

Result: Whenever Oxygen XML Developer plugin finds a character that cannot be rendered using its standard fonts, it will look for the glyph in the fonts stored in the fallback folder.

Alternate Solution for Other Platforms

For Mac OS X or other platforms, you could use the following approach:

- 1. Use a font editor (such as *FontForge*) to combine multiple true type fonts into a single custom font.
- 2. Install the font file into the dedicated font folder of your operating system.
- 3. In Oxygen XML Developer plugin, open the **Preferences** dialog box and go to **Appearance** > **Fonts**.
- **4.** Click the **Choose** button in the **Editor** option and select your custom font from the drop down list in the subsequent dialog box.
- **5.** Restart Oxygen XML Developer plugin for the font changes to take full effect.

Creating and Working with Documents

Oxygen XML Developer plugin includes various features, actions, and wizards to assist you with creating new files and working with existing files. This section explains many of these features, including information on creating new documents, opening, saving, and closing existing files, searching documents, viewing file properties, and more.

Creating New Documents

Oxygen XML Developer plugin includes a handy **New Document** wizard that allows you to customize and create new files from a large list of document types and predefined new file templates. You can also create your own templates and share them with others.

Oxygen XML Developer plugin New Document Wizard

The New Document wizard only creates a skeleton document. It contains the document prolog, a root element, and possibly other child elements depending on the options specific for each schema type. To generate full and valid XML instance documents based on an XML Schema, use the XML instance generation tool.

The Oxygen XML Developer plugin installs a series of Eclipse wizards for easy creation of documents. If you use these wizards, Oxygen XML Developer plugin automatically completes the following details:

- The system ID, or schema location of a new XML document.
- The minimal markup of a DocBook article, or the namespace declarations of a Relax NG schema.
- 1. To create a document, either select File > New > Other > Oxygen XML Developer plugin or click the New button on the toolbar. The **New** file wizard is displayed.
- 2. Select a document type. You can also select New from Templates to create a document based upon predefined templates or custom templates.
- **3.** Click the **Next** button.

For example if XML was selected the Create an XML Document wizard is started.

The Create an XML Document dialog box enables definition of an XML Document Prolog using the system identifier of an XML Schema, DTD, Relax NG (full or compact syntax) schema, or NVDL (Namespace-based Validation Dispatching Language) schema. As not all XML documents are required to have a Prolog, you can choose to skip this step by clicking **OK**. If the prolog is required, complete the fields as described in the next step.

- **4.** Type a name for the new document and press the **Next** button.
- 5. If you select Customize, Oxygen XML Developer plugin opens the following dialog box. You can customize various options, depending on the document type you select.

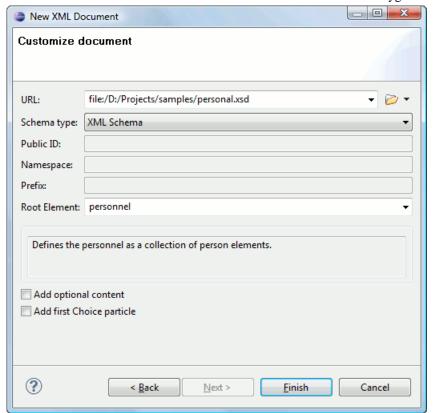

Figure 27: New XML Document Dialog Box

- URL Specifies the path to the schema file. When you select a file, Oxygen XML Developer plugin analyzes its content and tries to fill the rest of the dialog box.
- **Schema type** Allows you to select the schema type. The following options are available: XML Schema, DTD, RelaxNG XML syntax, RelaxNG compact syntax, and NVDL.
- **Public ID** Specifies the PUBLIC identifier declared in the document prolog.
- Namespace Specifies the document namespace.
- **Prefix** Specifies the prefix for the namespace of the document root.
- Root Element Populated with elements defined in the specified schema, enables selection of the element used
 as document root.
- **Description** A small description of the selected document root.
- Add optional content If you select this option, the elements, and attributes defined in the XML Schema as optional, are generated in the skeleton XML document.
- Add first Choice particle If you select this option, Oxygen XML Developer plugin generates the first element
 of an xs:choice schema element in the skeleton XML document. Oxygen XML Developer plugin creates this
 document in a new editor panel when you click Finish.

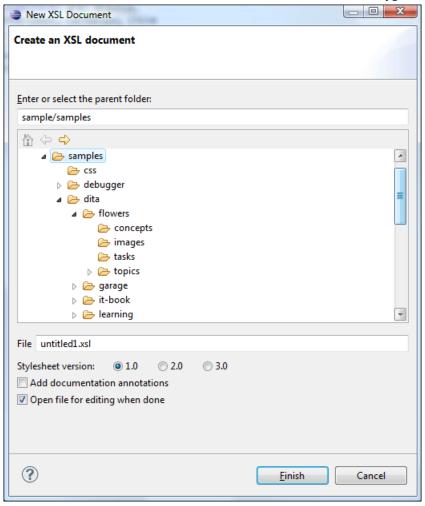

Figure 28: New XSL Document Dialog Box

- Stylesheet version Allows you to select the Stylesheet version number. You can select from: 1.0, 2.0, and 3.0.
- Add documentation annotations Adds annotation for XSL components.
- Open file for editing when done Specifies whether or not you want to open the newly created file in the editor.

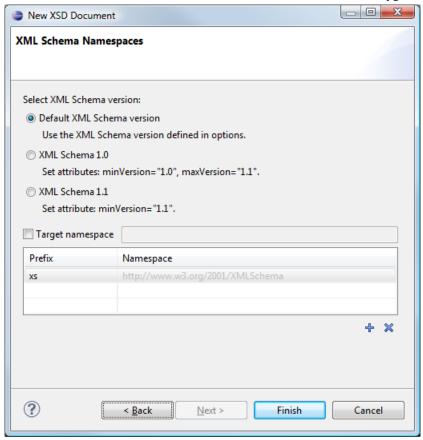

Figure 29: New XML Schema Document (XSD) Dialog Box

- **Default XML Schema version** Uses the XML Schema version defined in the **XML Schema** *preferences page*.
- XML Schema 1.0 Sets the minVersion attribute to 1.0 and the maxVersion attribute to 1.1.
- XML Schema 1.1 Sets the minVersion attribute to 1.1.
- Target namespace Specifies the schema target namespace.
- Namespace prefix declaration table Contains namespace prefix declarations. To manage table information, use the New and Delete buttons.
 - **Tip:** For further details on how you can set the version of an XML Schema, go to *Setting the XML Schema Version*.

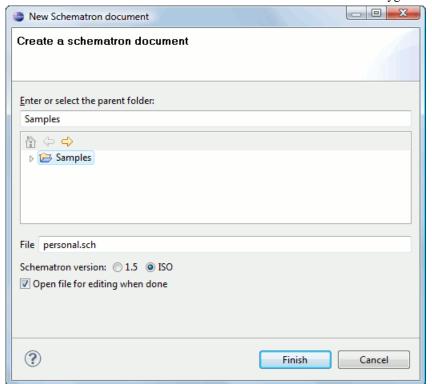

Figure 30: New Schematron Document Dialog Box

- Schematron version Specifies the Schematron version. Possible options: 1.5 and ISO.
- Open file for editing when done Specifies whether or not you want to open the file for editing purposes.

Creating New Documents Based on Templates

The New Document wizard allows you to select predefined templates or custom templates that were created in previous sessions or by other users.

The list of templates presented in the dialog box includes:

User defined templates - You can add your custom templates by creating template files in a directory and then add
that directory to the list of template directories that Oxygen XML Developer plugin uses in the *Document Templates*Preferences page.

Note: You can also use *editor variables* in the template file content and they will be expanded when the files are opened.

- Global templates Contains a list of predefined templates.
- Framework templates Contains the list of templates defined in the Document Type configuration dialog box (Templates tab).

To create a new document from a file template, follow these steps

- 1. Open the **New from Templates** wizard by doing one of the following:
 - a) Go to File > New > Other > Oxygen XML Developer plugin > New From Templates.
 - b) Click the New button on the toolbar and select New from Templates.
- 2. Select a document type and press Next.
- 3. Type a name for the new document and press Next.
- **4.** Press the **Finish** button.

The newly created document already contains the structure and content provided in the template.

Saving Documents

You can save the document you are editing with one of the following actions:

- File > Bave.
- File > Save As Displays the Save As dialog box, used either to name and save an open document to a file or to save an existing file with a new name.
- File > Save All Saves all open documents.

Opening and Saving Remote Documents via FTP/SFTP

Oxygen XML Developer plugin supports editing remote files, using the FTP, SFTP protocols. You can edit remote files in the same way you edit local files.

You can open one or more remote files in the Open using FTP/SFTP dialog box

To avoid conflicts with other users when you edit a resource stored on a SharePoint server, you can **Check Out** the resource.

To improve the transfer speed, the content exchanged between Oxygen XML Developer plugin and the HTTP / WebDAV server is compressed using the GZIP algorithm.

The current *WebDAV Connection* details can be saved using the **Database Perspective** button and then used in the *Data Source Explorer* view.

The Open Using FTP/SFTP/WebDAV Dialog Box

To access the **Open using FTP/SFTP/WebDAV** dialog box, go to **File > Open URL** menu, then choose the **Browse for remote file** option from the drop-down action list.

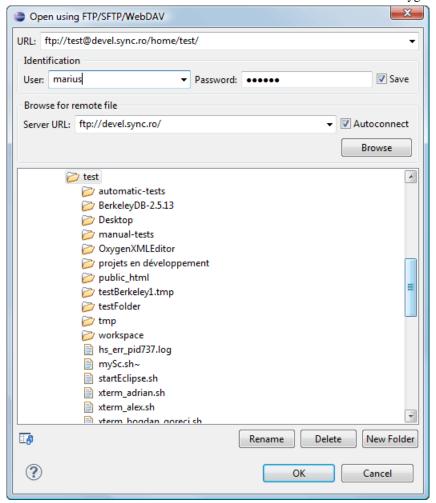

Figure 31: Open URL Dialog Box

The displayed dialog box is composed of several parts:

The editable URL combo box, in which you specify the URL to be opened or saved.

Tip: You can type a URL like: ftp://anonymous@some.site/home/test.xml, if the file is accessible through an anonymous FTP.

This combo box also displays the current selection when you change selection by browsing the tree of folders and files on the server.

• The **Identification** section contains the access credentials. If you want to browse for a file on a server, you have to specify the user and password. This information is bound to the selected URL and is also used in opening or saving the file. If the **Save** check box is selected, the user and password are saved between editing sessions. The password is encrypted and kept in the options file.

Note: Your password is well protected. If the options file is used on another machine by a user with a different user name the password, it will become unreadable since the encryption is user-name dependent. This is also true if you add URLs to your project that include a user and password.

• The **Browse for remote file** section contains the **Server URL** combo box and **Autoconnect** check box. In the **Server URL** combo box, you can specify the protocol, the server host name, or server IP.

Tip: When accessing a FTP server, you only need to specify the protocol and the host (such as ftp://server.com or if using a nonstandard port ftp://server.com:7800/).

By pressing the **Browse** button, the directory listing will be shown in the component. When **Autoconnect** is selected, every time the dialog box is displayed, the browse action will be performed.

The bottom part of the dialog box displays the tree view of the documents stored on the server. You can browse the
directories and make multiple selections. Additionally, you can use the Rename, Delete, and New Folder actions
to manage the file repository.

The file names are sorted in a case-insensitive manner.

Changing File Permissions on a Remote FTP Server

Some FTP servers allow the modification of permissions of the files served over the FTP protocol. This protocol feature is accessible directly in the FTP file browser dialog box by right-clicking a tree node and selecting the *Change permissions* menu item.

In this dialog box, the usual Unix file permissions *Read*, *Write*, and *Execute* are granted or denied for the file owner, owner group, and the rest of the users. The aggregate number of permissions is updated in the *Permissions* text field when it is modified with one of the check boxes.

WebDAV over HTTPS

If you want to access a WebDAV repository across an unsecure network, Oxygen XML Developer plugin allows you to load and save the documents over the HTTPS protocol (if the server understands this protocol) so that any data exchange with the WebDAV server is encrypted.

When a WebDAV repository is first accessed over HTTPS, the server hosting the repository will present a security certificate as part of the HTTPS protocol, without any user intervention. Oxygen XML Developer plugin will use this certificate to decrypt any data stream received from the server. For the authentication to succeed you should make sure the security certificate of the server hosting the repository can be read by Oxygen XML Developer plugin. This means that Oxygen XML Developer plugin can find the certificate in the key store of the Java Runtime Environment in which it runs. You know the server certificate is not in the JRE key store if you get the error *No trusted certificate found* when trying to access the WebDAV repository.

Troubleshooting HTTPS

When Oxygen XML Developer plugin cannot connect to an HTTPS-capable server, most likely there is no certificate set in the *Java Runtime Environment (JRE)* that Oxygen XML Developer plugin runs into. The following procedure describes how to:

- Export a certificate to a local file using any HTTPS-capable Web browser (for example Internet Explorer).
- Import the certificate file into the JRE using the keytool tool that comes bundled with Oxygen XML Developer plugin.
- 1. Export the certificate into a local file
 - a) Point your HTTPS-aware Web browser to the repository URL.

If this is your first visit to the repository it will be displayed a security alert stating that the security certificate presented by the server is not trusted.

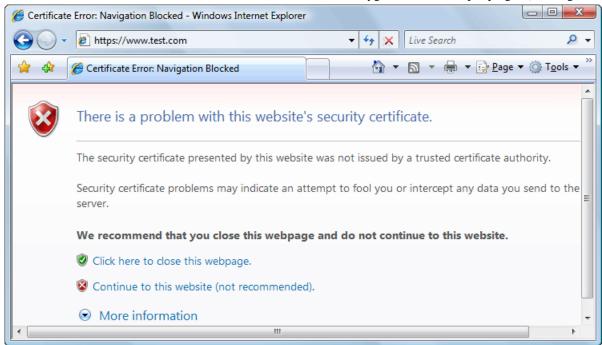

Figure 32: Security alert - untrusted certificate

- b) Go to menu **Tools** > **Internet Options**. **Internet Options** dialog box is opened.
- c) Select Security tab.
- d) Select Trusted sites icon.
- e) Press Sites button.

This will open **Trusted sites** dialog box.

- f) Add repository URL to Websites list.
- g) Close the **Trusted sites** and **Internet Options** dialog boxes.
- h) Try again to connect to the same repository URL in Internet Explorer.

The same error page as above will be displayed.

- i) Select Continue to this website option.
 - A clickable area with a red icon and text Certificate Error is added to Internet Explorer address bar.
- j) Click the **Certificate Error** area.
 - A dialog box containing a View certificates link is displayed.
- k) Click the View certificates link.
 - Certificate dialog box is displayed.
- 1) Select **Details** tab of **Certificate** dialog box.
- m) Press Copy to File button.
 - Certificate Export Wizard is started.
- n) Follow indications of wizard for DER encoded binary X.509 certificate. Save certificate to local file server.cer.
- 2. Import the local file into the JRE running Oxygen XML Developer plugin.
 - a) Open a text-mode console with administrative rights.
 - b) Go to the lib/security directory of the JRE running Oxygen XML Developer plugin. You find the home directory of the JRE in the *java.home* property that is displayed in the **About** dialog box (**Installation Details** > **Configuration**). On Mac OS X systems, the lib/security directory is usually located in /System/Library/Java/JavaVirtualMachines/1.6.0.jdk/Contents/Home directory.
 - c) Run the following command:

The server.cer file contains the server certificate, created during the previous step. keytool requires a password before adding the certificate to the JRE *keystore*. The default password is changeit. If somebody changed the default password then he is the only one who can perform the import.

Note: To make Oxygen XML Developer plugin accept a certificate even if it is invalid, *open the Preferences dialog box*, go to **Connection settings** > **HTTP(S)/WebDAV**, and enable the **Automatically accept a security certificate**, **even if invalid** option.

Tip: If you need to import multiple certificates, you need to specify a different alias for each additional imported certificate with the -alias command line argument, like in the following example:

```
..\..\bin\keytool -import -alias myaliasl -trustcacerts -file server1.cer -keystore cacerts ..\..\bin\keytool -import -alias myalias2 -trustcacerts -file server2.cer -keystore cacerts
```

3. Restart Oxygen XML Developer plugin.

HTTP Authentication Schemes

Oxygen XML Developer plugin supports the following HTTP authentication schemes:

- **Basic** The *basic* authentication scheme defined in the *RFC2617 specifications*.
- **Digest** The *digest* authentication scheme defined in the *RFC2617 specifications*.
- **NTLM** The *NTLM* scheme is a proprietary Microsoft Windows Authentication protocol (considered to be the most secure among currently supported authentication schemes).

Note: For NTLM authentication, the user name must be preceded by the name of the domain it belongs to, as in the following example:

```
domain\username
```

• *Kerberos* - An authentication protocol that works on the basis of *tickets* to allow nodes communicating over a non-secure network to prove their identity to one another in a secure manner.

Single Sign-on

Oxygen XML Developer plugin implements the *Single sign-on* property (meaning that you can log on once and gain access to multiple services without being prompted to log on for each of them), based on the *Kerberos* protocol and relies on a *ticket-granting ticket* (*TGT*) that Oxygen XML Developer plugin obtains from the operating system.

To turn on the *Kerberos*-based authentication, you need to add the following system property in the eclipse.ini configuration file (on a separate line after the -vmargs parameter):

```
-Djavax.security.auth.useSubjectCredsOnly=false
```

Closing Documents

To close open documents, use one of the following methods:

- Click Close(Ctrl F4 (Command F4 on OS X)) in the contextual menu of an open tab (or from the File menu) to close it.
- Click **Close Other Files** in the contextual menu of an open tab (or from the **File** menu) to close all the open tabs except the selected one.
- Click Close All(Ctrl Shift F4 (Meta Shift F4 on OS X)) in the contextual menu of an open tab (or from the File menu) to close all open tabs.

The Contextual Menu of the Current Editor Tab

The contextual menu is available when you right-click the current editor tab label. It includes the following actions:

Close

Closes the current editor.

Close Other Files

Closes all opened editor but the one you are currently viewing.

Close All

Closes all opened editors.

Reopen last closed editor

Reopens the last closed editor.

Maximize/Restore Editor Area

Collapses all the side views and spans the editing are to cover the entire width of the main window.

Add to project

Adds the file you are editing to the current project.

Add all to project

Adds all the opened files to the current project.

Copy Location

Copies the disk location of the file.

Show in Explorer (Show in Finder on OS X)

Opens the Explorer to the file path of the file.

Viewing File Properties

The **Editor Properties** view, you can quickly access information about the currently edited document. The information includes:

- Character encoding.
- Full path on the file system.
- Schema used for content completion and document validation.
- · Document type name and path.
- Associated transformation scenario.
- Read-only state of a file.
- Bidirectional text (left to right and right to left) state.
- Total number of characters in the document.
- Line width.
- Indent with tabs state.
- Indent size.

The view can be accessed from Window > Show View > Other > Editor Properties.

To copy a value from the **Editor Properties** view in the clipboard, for example the full file path, use the **Copy** action available on the contextual menu of the view.

Using Projects to Group Documents

This section explains how to create and work with Projects.

Creating a New Project

Oxygen XML Developer plugin allows you to organize your XML-related files into projects. This helps you manage and organize your files and also allows you to perform batch operations (such as validation and transformation) over multiple files. Use the *Navigator view* to manage projects, and the files and folders contained within.

Creating a New Project

To create a new project, select New > XML Project or New > Sample XML Project from the contextual menu or File menu. This opens a dialog box that allows you to create and customize a new project and adds it to the structure of the project in the *Navigator* view.

Adding Items to the Project

To add items to the project, select the desired document type or folder from the New menu of the contextual menu, when invoked from the Navigator view (or from the File menu). You can also create a document from a template by selecting **New > New from Templates** from the contextual menu.

Using Linked Folders (Shortcuts)

Another easy way to organize your XML working files is to place them in a directory and then to create a corresponding linked folder in you project. If you add new files to that folder, you can simply use the **Refresh** (F5) action from the toolbar or contextual menu and the Navigator view will display the existing files and subdirectories. If your files are scattered amongst several folders, but represent the same class of files, you might find it useful to combine them in a logical folder.

You can create linked folders (shortcuts) by dragging and dropping folders from the Windows Explorer (Mac OS X Finder) to the project tree, or by using the contextual menu from the location in the project tree where you want it added and selecting **New > Folder > Advanced**. The linked folders presented in the **Navigator** view are marked with a special icon. To create a file inside a linked folder, use the contextual menu and select New > File (you can use the Advanced button to link to a file in the local file system).

Note: Files may have multiple instances within the folder system, but cannot appear twice within the same

For much more information on managing projects and their content, see the *The Navigator View* on page 49 section.

The Navigator View

The **Navigator** view is designed to assist you with organizing and managing related files grouped in the same XML project. The actions available on the contextual menu and toolbar associated to this panel enable the creation of XML projects and shortcuts to various operations on the project documents.

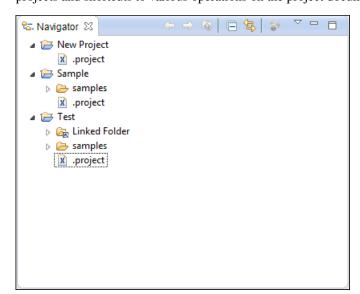

Figure 33: The Navigator View

The following actions are grouped in the upper right corner:

Collapses all project tree folders. You can also collapse/expand a project tree folder if you select it and press the **Enter** key or **Left Arrow** to collapse and **Right Arrow** to expand.

🦩 Link with Editor

When selected, the project tree highlights the currently edited file, if it is found in the project files.

Note: This button is disabled automatically when you move to the **Debugger** perspective.

View Menu

Drop-down menu that contains various settings.

The files are usually organized in an XML project as a collection of folders. There are two types of resources displayed in the **Navigator** view:

- Physical folders and files marked with the operating system-specific icon for folders (usually a yellow icon on Windows and a blue icon on Mac OS X). These folders and files are mirrors of real folders or files that exist in the local file system. They are created or added to the project by using contextual menu actions (such as New > File and New > Folder). Also, the contextual menu action
 Delete can be used to remove them from the project and local file system.
- Shortcut folders and files the icons for file and folder shortcuts are displayed with a shortcut symbol. They are created and added by using the actions New > File > Advanced or New > Folder > Advanced from the contextual menu or File menu. Also, the contextual menu action ▶ Delete can be used to remove them from the project (the local file system remains unchanged).

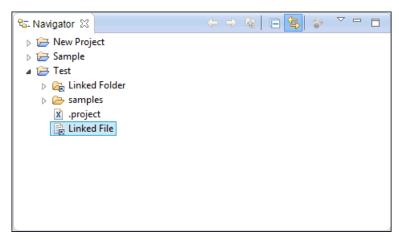

Figure 34: The Navigator View with Examples of the Two Types of Resources

Creating New Projects

The following actions are available by selecting **New** from the contextual menu or **File** menu:

New > XML Project

Opens the **New XML Project** dialog box that allows you to create a new project and adds it to the project structure in the **Navigator** view.

New > Sample XML Project

Opens the **New sample XML project** dialog box that allows you to customize sample resources in a new project and adds it to the project structure in the **Navigator** view.

Creating New Project Items

To create new project items, select the desired document type or folder from the **New** menu of the contextual menu, when invoked from the **Navigator** view (or from the **File** menu). You can also create a document from a template by selecting **New** > **New from Templates** from the contextual menu.

New $> \square$ File

Opens a New file dialog box that helps you create a new file and adds it to the project structure.

New > || Folder

Opens a **New Folder** dialog box that allows you to specify a name for a new folder and adds it to the structure of the project.

New > Logical Folder

Available when invoked from the *project root*, this action creates a logical folder in the tree structure (the icon is a magenta folder on Mac OS X - (a)).

New > Logical Folders from Web

Available when invoked from the *project root*, this action replicates the structure of a remote folder accessible over FTP/SFTP/WebDAV, as a structure of logical folders. The newly created logical folders contain the file structure of the folder it points to.

Managing Project Content

Creating/Adding Files and Folders

You can create linked folders (shortcuts) by dragging and dropping folders from the Windows Explorer / Mac OS X Finder to the project tree, or by using the contextual menu from the location in the project tree where you wanted it added and selecting **New** > **Folder** > **Advanced**. To create a file inside a linked folder, use the contextual menu and select **New** > **File** (you can use the **Advanced** button to link to a file in the local file system).

=

Note: The linked folders presented in the **Navigator** view are marked with a special icon.

You can create physical folders by selecting **New** > **Folder** from the contextual menu.

When adding files to a project, the default target is the project root. To change a target, select a new folder. Files may have multiple instances within the folder system, but cannot appear twice within the same folder.

Removing Files and Folders

To remove one or more files or folders, select them in the project tree and press the **<u>Delete</u>** key, or select the contextual menu action **Delete**.

Caution: In most cases this action is irreversible, deleting the file permanently. Under particular circumstances (if you are running a Windows installation of Oxygen XML Developer plugin and the *Recycle Bin* is active) the file is moved to *Recycle Bin*.

Moving Files and Folders

You can move the resources of the project with drag and drop operations on the files and folders of the tree.

You can also use the usual Copy and Paste actions to move resources in the Navigator view.

Renaming Files and Folders

There are two ways you can *rename an item in the Navigator view*. Select the item in the **Navigator** view and do one of the following:

- Invoke the **Rename** action from the contextual menu.
- Press **F2** and type the new name.

To finish editing the item name, press **Enter**.

Locating and Opening Files

If a project folder contains a lot of documents, a certain document can be located quickly in the project tree by selecting the folder containing the desired document and typing the first few characters of the document name. The desired document is automatically selected as soon as the typed characters uniquely identify its name in the folder.

The selected document can be opened by pressing the **Enter** key, by double-clicking it, or with one of the **Open** actions from the contextual menu. The files with known document types are opened in the associated editor, while binary files are opened with the associated system application. To open a file with a known document type in an editor other than the default one, use the **Open with** action. Also, dragging and dropping files from the project tree to the editor area results in the files being opened.

Saving the Project

The project file is automatically saved every time the content of the **Navigator** view is saved or modified by actions such as adding or removing files and drag and drop.

Validate Files

The currently selected files associated with the Oxygen XML Developer plugin in the **Package Explorer** view or in the **Navigator** view can be checked to be XML well-formed or validated against a schema (DTD, XML Schema, Relax NG, Schematron or NVDL) with one of the following contextual menu actions found in the **Validate** sub-menu:

Validate > Check Well-Formedness

Checks if the selected file or files are well-formed.

Validate Validate

Validates the selected file or files against their associated schema. EPUB files make an exception, because this action triggers a *Validate and Check for Completeness* operation.

ValidateValidate with Schema

Validates the selected file of files against a specified schema.

Validate Configure Validation Scenario(s)

Allows you to configure and run a validation scenario.

Validate > X Clear Validation Markers

Clears all the error markers from the main editor and **Problems** view.

Applying Transformation Scenarios

The currently selected files associated with the Oxygen XML Developer plugin in the **Package Explorer** view or in the **Navigator** view can be transformed in one step with one of the following actions available from contextual menu in the **Transform** sub-menu:

Transform > P Apply Transformation Scenario(s)

Obtains the output with one of the built-in scenarios.

Transform > Configure Transformation Scenario(s)

Opens a dialog box that allows you to configure pre-defined transformation scenarios.

Transform > 🥕 Transform with

Allows you to select a transformation scenario to be applied to the currently selected files.

Refactoring Actions (Available for certain document types (such as XML, XSD, and XSL)

Oxygen XML Developer plugin includes some refactoring operations that help you manage the structure of your documents. The following actions are available from the contextual menu in the **Refactoring** sub-menu:

Refactoring > Rename resource

Allows you to change the name of a resource.

Refactoring > Move resource

Allows you to change the location on disk of a resource.

Refactoring > XML Refactoring

Opens the XML Refactoring tool wizard that presents refactoring operations to assist you with managing the structure of your XML documents.

Other Contextual Menu Actions

Other actions that are available in the contextual menu from the project tree include:

Open

Opens the selected file in the editor.

Open with submenu

This submenu offers you choices for opening the selected file in various editors.

Refresh

Refreshes the content and the dependencies between the resources in the Master Files directory.

// XPath in Files

Opens the *XPath/XQuery Builder view* that allows you to compose XPath and XQuery expressions and execute them over the currently edited XML document.

Check Spelling in Files

Allows you to *check the spelling of multiple files*.

Format and Indent Files

Opens the *Format and Indent Files dialog box* that allows you to configure the format and indent (pretty print) action that will be applied on the selected documents.

Properties

Displays the properties of the current file in a **Properties** dialog box.

Moving/Renaming Resources in the Navigator View

The **Navigator** view allows you to move or rename files in the current project.

Moving Resources

To move a file or directory in the **Navigator** view, drag and drop it to the new location in the tree structure or use the **Move** action from the contextual menu (you can also use the **Copy** and **Paste** actions from the contextual menu or **Edit** menu to copy resources to a new location).

You can also move certain types of files (such as XML, XML Schema, Relax NG, WSDL, and XSLT) by using the **Refactoring** > **Move resource** action from the contextual menu. This action opens the **Move resource** dialog box that includes the following options:

- **Destination** Presents the path to the current location of the resource you want to move and gives you the option to introduce a new location.
- New name Presents the current name of the moved resource and gives you the option to change it.
- **Update references of the moved resource(s)** Enable this option to update the references to the resource you are moving, based upon the selected scope. You can *select or configure the scope* by using the button.

Renaming Resources

To quickly rename a file or a directory, use the in-place editing either by pressing $\underline{F2}$ or by selecting **Rename** from the contextual menu.

You can also rename certain types of files (such as XML, XML Schema, Relax NG, WSDL, and XSLT) by using the **Refactoring** > **Rename resource** action from the contextual menu. This action opens the **Rename resource** dialog box that includes the following options:

- New name Presents the current name of the edited resource and allows you to modify it.
- **Update references of the renamed resource** Enable this option to update the references to the resource you are renaming. You can *select or configure the scope* by using the button.

Problems Updating References of Moved/Renamed Resources

In some case the references of a moved or a renamed resource can not be updated. For example, when a resource is resolved through an XML catalog or when the path to the moved or renamed resource contains entities. For these cases, Oxygen XML Developer plugin displays a warning dialog box.

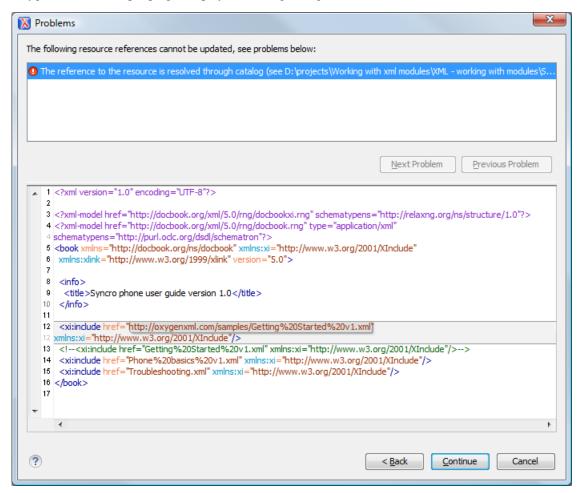

Figure 35: Problems Dialog Box

Defining Master Files at Project Level

This chapter details the Master Files Support available in Oxygen XML Developer plugin.

The **Master Files Support** helps you simplify the configuration and development of XML projects. A *Master File* typically refers to the root of an import/include tree of modules.

Introduction to Master Files at Project Level

Oxygen XML Developer plugin allows you to define *master files* at project level. These *master files* are automatically used by Oxygen XML Developer plugin to determine the context for operations such as validation, content completion, refactoring, or search for XML, XSD, XSL, WSDL, and RNG modules. Oxygen XML Developer plugin maintains the hierarchy of the *master files*, helping you to determine the editing context.

To watch our video demonstration about the **Master Files Support** for XML documents, XSL documents, and WSDL documents, go to *Working with Modular XML Files*, *Master Files Support*, and *Working with Modular WSDL Files*, respectively.

Master Files Benefits

When you edit a module after defining the *master files*, you have the following benefits:

- When the module is validated, Oxygen XML Developer plugin automatically identifies the master files that include
 the module and validates all of them.
- The Content Completion Assistant presents all the components that are collected, from the master files to the modules
 they include.
- The **Outline** view displays all the components that are defined in the *master files* hierarchy.
- The *master files* that are defined for the current module determines the *scope of the search and refactoring actions*. Oxygen XML Developer plugin performs the search and refactoring actions in the context that the *master files* determine, thus improving the speed of execution.

Enabling the Master Files Support

Oxygen XML Developer plugin stores the *master files* in a folder located in the **Navigator** view, as the first child of the project root. The **Master Files Support** is disabled by default. To enable the **Master Files Support**, use the **Enable Master Files Support** action from the contextual menu of the project itself. Oxygen XML Developer plugin allows you to enable/disable the **Master Files Support** for each project you are working on.

Detecting Master Files

Oxygen XML Developer plugin allows you to detect the *master files* using the **Detect Master Files** option available in the contextual menu of the project. This action applies to the folders you select in the project. To detect *master files* over the entire project, do one of the following:

- Right-click the root of the project and select Detect Master Files.
- Use the Detect Master Files from Project option, available in the contextual menu of the Master Files folder.

Both of these options display the **Detect Master Files** wizard. In the first panel you can select the type of *master files* you want Oxygen XML Developer plugin to detect. In the subsequent panel the detected *master files* are presented in a tree-like fashion. The resources are grouped into three categories:

- Possible *master files* the files presented on the first level in this category are not imported/included from other files. These files are most likely to be set as *master files*.
- Cycles the files that are presented on the first level have circular dependencies between them. Any of the files presented on the first level of a cycle is a possible *master file*.
- Standalone files that do not include/import other files and are also not included/imported themselves. It is not necessary to set them as *master files*.

To set them as *master files*, enable their check-boxes. Oxygen XML Developer plugin marks all the children of a *master file* as modules. Modules are rendered in gray and their tool-tip presents a list of their *master files*. A module can be accessed from more than one *master file*.

The *master files* that are already defined in the project are automatically marked in the tree and cannot be removed. The only way to disable a *master file* is to delete it from the Master Files folder.

The next panel displays a list with the selected *master files*. Click the **Finish** button to add the *master files* in the Master Files folder.

You can use the **Select Master Files** option to automatically mark all *master files*. This action sets all the resources from the **Possible Master Files** category and the first resource of each **Cycle** as *master files*.

Tip: We recommend you to only add top-level files (files that are at the root of the include/import graph) in the Master Files directory. Keep the file set to a minimum and only add files that import or include other files.

Adding/Removing a Master File

The Master Files directory only contains logical folders and linked files. To add files in the Master Files directory, use one of the following methods:

- Right-click a file from your project and select **W** Add to Master Files from the contextual menu.
- Drag and drop files into the Master Files directory.
- From the contextual menu of the Resource Hierarchy Dependencies view, use the Add to Master Files action.

You can view the *master files* for the currently edited resource in the **Editor Properties** view.

Editing XML Documents

This section explains the XML editing features of the application. All the user interface components and actions available to users are described in detail with appropriate procedures for various tasks.

Editing XML Documents in Text Mode

This section includes features and actions for editing XML documents in the **Text** mode of Oxygen XML Developer plugin.

Contextual Menu Actions in Text Mode

When editing XML documents in **Text** mode, Oxygen XML Developer plugin provides the following actions in the contextual menu (many of them also appear in the submenus of the **Document** menu):

Executes the typical editing actions on the currently selected content.

Copy XPath

Copies the XPath expression of the current element or attribute from the current editor to the clipboard.

Toggle Comment (Ctrl Shift Comma (Meta Shift Comma on OS X))

Comments the current selection of the current editor. If the selection already contains a comment the action removes the comment from around the selection. If there is no selection in the current editor and the cursor is not positioned inside a comment the current line is commented. If the cursor is positioned inside a comment then the commented text is uncommented.

Go to submenu

This submenu includes the following actions:

Moves the cursor to the end tag that matches the start tag, or vice versa.

Go after Next Tag (Ctrl Close Bracket (Meta Close Bracket on OS X))

Moves the cursor to the end of the next tag.

Go after Previous Tag (Ctrl Open Bracket (Meta Open Bracket on OS X))

Moves the cursor to the end of the previous tag.

Select submenu

This submenu allows you to select the following:

Element

Selects the entire element at the current cursor position.

Content

Selects the entire content of the element at the current cursor position, excluding the start and end tag. Performing this action repeatedly will result in the selection of the content of the ancestor of the currently selected element content.

Attributes

Selects all the attributes of the element at the current cursor position.

Parent

Selects the parent of the element at the current cursor position.

Source submenu

This submenu includes the following actions:

Shift Right

Shifts the currently selected block to the right.

Shift Left

Shifts the currently selected block to the left.

Indent selection (Ctrl I (Meta I on OS X))

Corrects the indentation of the selected block of lines if it does not follow the current *indenting preferences*.

* Escape Selection

Escapes a range of characters by replacing them with the corresponding character entities.

Unescape Selection

Replaces the character entities with the corresponding characters.

Format and Indent Element (Ctrl Shift I (Meta Shift I on OS X))

Pretty prints the element that surrounds the current cursor position.

Convert Hexadecimal Sequence to Character (Ctrl + Shift + H (Meta + Shift + H on OS X))

Converts a sequence of hexadecimal characters to the corresponding Unicode character. A valid hexadecimal sequence can be composed of 2 to 4 hexadecimal characters, preceded or not by the 0x or 0x prefix. Examples of valid sequences: 0x0045, 0x0125, 1253, 265, 43.

To convert a hexadecimal sequence to a character, do one of the following:

- place the cursor at the right side of a valid hexadecimal sequence, then press <u>Ctrl + Shift + H (Meta + Shift + H on OS X)</u> on your keyboard
- select a valid hexadecimal sequence, then press <u>Ctrl + Shift + H (Meta + Shift + H on OS X)</u> on your keyboard

Join and Normalize Lines

For the current selection, this action joins the lines by replacing the *line separator* with a single space character. It also normalizes the whitespaces by replacing a sequence of such characters with a single space.

Insert XInclude

Displays a dialog box that allows you to browse and select the content to be included and automatically generates the corresponding XInclude instruction.

Note: In the **Author** mode, this dialog box presents a preview of the inserted document as an author page in the **Preview** tab and as a text page in the **Source** tab. In the **Text** mode, the **Source** tab is presented.

La Import entities list

Displays a dialog box that allows you to select a list of files as sources for external DTD entities. The internal subset of the DOCTYPE declaration of your document will be updated with the chosen entities. For instance, choosing the files chapter1.xml and chapter2.xml inserts the following section in the DOCTYPE:

```
<!ENTITY chapter1 SYSTEM "chapter1.xml">
<!ENTITY chapter2 SYSTEM "chapter2.xml">
```

Canonicalize

Opens the Canonicalize dialog box that allows you to select a canonicalization algorithm to standardize the format of the document.

Sign

Opens the Sign dialog box that allows you to configure a digital signature for the document.

Verify Signature

Allows you to specify the location of a file to verify its digital signature.

Manage Highlighted Content submenu

This submenu is available from the contextual menu when it is invoked from a highlight after you perform a search operation or apply an XPath expression that highlights more than one result. The following options are available in this submenu:

Modify All

Allows you to modify (in-place) all the occurrences of the selected content. A thin rectangle replaces the highlights and allows you to start editing. If matches with different letter cases are found, a dialog box is displayed that allows you select whether you want to modify only matches with the same letter case or all matches.

Surround All

Surround the highlighted content with a specific tag. This option opens the **Tag** dialog box. The **Specify the tag** drop-down menu presents all the available elements that you can choose from.

Remove All

Removes all the highlighted content.

Modify All Matches

Use this option to modify (in-place) all the occurrences of the selected content (or the contiguous fragment in which the cursor is located). When you use this option, a thin rectangle replaces the highlights and allows you to start editing. If matches with different letter cases are found, a dialog box is displayed that allows you select whether you want to modify only matches with the same letter case or all matches.

Show Definition (Ctrl Shift Enter)

Moves the cursor to the definition of the current element or attribute in the schema (DTD, XML Schema, Relax NG schema) associated with the edited XML document. If the current attribute is a "type" belonging to the "http://www.w3.org/2001/XMLSchema-instance" namespace, the cursor is moved in the XML schema to the definition of the type referenced in the value of the attribute.

Refactoring submenu

This submenu includes the following actions:

Rename Element

The element from the cursor position, and any elements with the same name, can be renamed according with the options from the **Rename** dialog box.

Rename Prefix (Alt Shift P)

The prefix of the element from the cursor position, and any elements with the same prefix, can be renamed according with the options from the **Rename** dialog box.

If you select the **Rename current element prefix** option, the application will recursively traverse the current element and all its children.

Note: For example, to change the xmlns:pl="ns1" association in the current element to xmlns:p5="ns1", if the xmlns:p1="ns1" association is applied on the parent element, then Oxygen XML Developer plugin will introduce xmlns:p5="ns1" as a new declaration in the current element and will change the prefix from p1 to p5. If p5 is already associated with another namespace in the current element, then the conflict will be displayed in a dialog box. By pressing **OK**, the prefix is modified from p1 to p5 without inserting a new declaration.

- If you select the **Rename current prefix in all document** option, the application will apply the change on the entire document.
- To also apply the action inside attribute values, check the **Rename also attribute values that start with the same prefix** checkbox.

Surround with submenu

Presents a drop-down menu that allows you to choose a tag to surround a selected portion of content.

\blacktriangle Surround with Tags (Alt + Shift + E)

Allows you to choose a tag that encloses a selected portion of content. If there is no selection, the start and end tags are inserted at the cursor position.

- If the **Cursor position between tags** option is enabled in the *Content Completion Preferences page*, the cursor is placed between the start and end tag.
- If the **Cursor position between tags** option is disabled in the *Content Completion Preferences page*, the cursor is placed at the end of the start tag, in an insert-attribute position.

"" Surround with (Alt + Shift + /)

Surround the selected content with the last tag used.

$\stackrel{\text{def}}{=}$ Delete element tags (Alt + Shift + ,)

Deletes the start and end tag of the current element.

Split element

Split the element from the cursor position into two identical elements. The cursor must be inside the element.

Solution Join elements (Alt Shift F (Meta Alt F on OS X))

Joins the left and right elements relative to the current cursor position. The elements must have the same name, attributes, and attributes values.

Attributes submenu

Contains predefined XML refactoring operations that pertain to attributes. Oxygen XML Developer plugin considers the editing context to get the names and namespaces of the element or attribute for which the contextual menu was invoked, and uses this information to preconfigure some of the parameter values for the selected refactoring operation.

Add/Change attribute

Allows you to change the value of an attribute or insert a new one.

Delete attribute

Allows you to remove one or more attributes.

Rename attribute

Allows you to rename an attribute.

Replace in attribute value

Allows you to search for a text fragment inside an attribute value and change the fragment to a new value.

Elements submenu

Contains predefined XML refactoring operations that pertain to elements. Oxygen XML Developer plugin considers the editing context to get the names and namespaces of the element or attribute for which the contextual menu was invoked, and uses this information to preconfigure some of the parameter values for the selected refactoring operation.

Delete element

Allows you to delete elements.

Delete element content

Allows you to delete the content of elements.

Insert element

Allows you to insert new elements.

Rename element

Allows you to rename elements.

Unwrap element

Allows you to remove the surrounding tags of elements, while keeping the content unchanged.

Wrap element

Allows you to surround elements with element tags.

Wrap element content

Allows you to surround the content of elements with element tags.

Fragments submenu

Contains predefined XML refactoring operations that pertain to XML fragments. Oxygen XML Developer plugin considers the editing context to get the names and namespaces of the element or attribute for which the contextual menu was invoked, and uses this information to preconfigure some of the parameter values for the selected refactoring operation.

Insert XML fragment

Allows you to insert an XML fragment.

Replace element content with XML fragment

Allows you to replace the content of elements with an XML fragment.

Replace element with XML fragment

Allows you to replace elements with an XML fragment.

Manage IDs submenu

This submenu is available for XML documents that have an associated DTD, XML Schema, or Relax NG schema. It includes the following actions:

ĒN Rename in

Renames the ID and all its occurrences. Selecting this action opens the Rename XML ID dialog box. This dialog box lets you insert the new ID value and choose the scope of the rename operation. For a preview of the changes you are about to make, click **Preview**. This opens the **Preview** dialog box, which presents a list with the files that contain changes and a preview zone of these changes.

Rename in File

Renames the ID you are editing and all its occurrences from the current file.

Search References

Searches for the references of the ID. By default, the scope of this action is the current project. If you configure a scope using the Select the scope for the Search and Refactor operations dialog box, this scope will be used instead.

Search References in

Searches for the references of the ID. Selecting this action opens the Select the scope for the Search and Refactor operations.

Search Declarations

Searches for the declaration of the ID reference. By default, the scope of this action is the current project. If you configure a scope using the Select the scope for the Search and Refactor operations dialog box, this scope will be used instead.

Search Declarations in

Searches for the declaration of the ID reference. Selecting this action opens the Select the scope for the Search and Refactor operations.

Search Occurrences in file

Searches for the declaration an references of the ID in the current document.

Quick Assist (Ctrl 1 (Meta 1 on OS X))

Available when the cursor is inside an ID or IDREF, this action opens the Quick Assist window that allows you to select some search and refactoring actions for the selected ID or IDREF.

Open File at Cursor

Opens the file at the cursor position in a new panel. If the file path represents a directory path, it will be opened in system file browser. If the file at the specified location does not exist, an error dialog box is displayed and it includes a Create new file button that starts the New document wizard. This allows you to choose the type or the template for the file. If the action succeeds, the file is created with the referenced location and name and is opened in a new editor panel.

Resource Hierarchy

Opens the Resource Hierarchy/Dependencies view that allows you to see the resource hierarchy for an XML document.

Resource Dependencies

Opens the Resource Hierarchy/Dependencies view that allows you to see the resource dependencies for an XML document.

Smart Editing

Oxygen XML Developer plugin includes *smart editing* features to help you edit XML documents in **Text** mode. The following smart editing features are included:

- Closing tag auto-expansion This feature helps save some keystrokes by automatically inserting a closing tag when you insert a complete start tag and the cursor is automatically placed in between the start and end tags. For instance, after entering a start <tag>, the corresponding closing </tag> is automatically inserted and the cursor is placed between the two (<tag>|</tag>.
- Auto-rename matching tag When you edit the name of a start tag, Oxygen XML Developer plugin will mirror-edit the name of the matching end tag. This feature can be controlled from the *Content Completion option page*.
- Auto-breaking the edited line The Hard line wrap option automatically breaks the edited line when its length exceeds the maximum line length defined for the format and indent operation.
- Indent on Enter The Indent on Enter option indents the new line inserted when you press Enter.
- Smart Enter The Smart Enter option inserts an empty line between the start and end tags. If you press Enter between a start and end tag, the action places the cursor in an indented position on the empty line between the lines that contain the start and end tag.
- Double-click A double-click selects a certain text, depending on the position of the click in the document:
 - If the click position is on a start tag or end tag, then the element name is selected.
 - If the click position is after a start tag or before an end tag, then the entire content of the element without the start and end tags is selected.
 - If the click position is before a start tag or after an end tag, then the entire tag is selected, including the start and end tags, and the content in between.
 - If the click position is immediately before an attribute, then the entire attribute and its value is selected.
 - If the click position is immediately after the opening quote or immediately before the closing quote of an attribute value, then the entire attribute value is selected.
 - Otherwise, a double-click selects contiguous text.
- *Triple-click* A triple-click selects the entire current line of text.

Highlight ID Occurrences in Text Mode

To see the occurrences of an ID in an XML document in the **Text** mode, place the cursor inside the ID declaration or reference. The occurrences are marked in the vertical side bar at the right of the editor. Click a marker on the side bar to jump to the occurrence that it corresponds to. The occurrences are also highlighted in the editing area.

Note: Highlighted ID declarations are rendered with a different color than highlighted ID references. To customize these colors or disable this feature, *open the Preferences dialog box* and go to *Editor* > *Mark Occurrences*.

Quick Assist Support for IDs and IDREFS

The Quick Assist support is activated automatically when you place the cursor inside and ID or an IDREF. To access it, click the yellow bulb help marker placed on the current line, in the line number stripe of the editor. You can also invoke the quick assist menu from the contextual menu or by pressing **Ctrl 1** (**Meta 1 on Mac OS X**) on your keyboard.

The following actions are available:

Renames the ID and all its occurrences. Selecting this action opens the **Rename XML ID** dialog box. This dialog box lets you insert the new ID value and *choose the scope of the rename operation*. For a preview of the changes you are about to make, click **Preview**. This opens the **Preview** dialog box, which presents a list with the files that contain changes and a preview zone of these changes.

Search Declarations

Searches for the declaration of the ID reference. By default, the scope of this action is the current project. If you configure a scope using the *Select the scope for the Search and Refactor operations* dialog box, this scope will be used instead.

Search References

Searches for the references of the ID. By default, the scope of this action is the current project. If you configure a scope using the *Select the scope for the Search and Refactor operations* dialog box, this scope will be used instead.

Change scope

Opens the Select the scope for the Search and Refactor operations dialog box.

Rename in File

Renames the ID you are editing and all its occurrences from the current file.

Search Occurrences

Searches for the declaration an references of the ID located at the cursor position in the current document.

Formatting and Indenting XML Documents

Oxygen XML Developer plugin creates XML documents using several different *edit modes*. In *text mode*, you as the author decide how the XML file is formatted and indented. In the other modes, and when you switch between modes, Oxygen XML Developer plugin must decide how to format and indent the XML. Oxygen XML Developer plugin will also format and indent your XML for you in text mode if you use one of the Format and Indent options:

- **Document** > **Source** > **Format and Indent** Formats and indents the whole document.
- **Document** > **Source** > **Indent Selection** Indents the current selection (but does not add line breaks). This action is also available in the **Source** submenu of the contextual menu.
- **Document** > **Source** > **Format and Indent Element** Formats and indents the current element (the inmost nested element which currently contains the cursor) and its child-elements. This action is also available in the **Source** submenu of the contextual menu.

A number of settings affect how Oxygen XML Developer plugin formats and indents XML. Many of these settings have to do with how whitespace is handled.

Significant and insignificant whitespace in XML

XML documents are text files that describe complex documents. Some of the white space (spaces, tabs, line feeds, etc.) in the XML document belongs to the document it describes (such as the space between words in a paragraph) and some of it belongs to the XML document (such as a line break between two XML elements). Whitespace belonging to the XML file is called *insignificant whitespace*. The meaning of the XML would be the same if the insignificant whitespace were removed. Whitespace belonging to the document being described is called *significant whitespace*.

Knowing when whitespace is significant or insignificant is not always easy. For instance, a paragraph in an XML document might be laid out like this:

```
NO Freeman shall be taken or imprisoned, or be disseised of his Freehold, or Liberties, or free Customs, or be outlawed, or exiled, or any other wise destroyed; nor will We not pass upon him, nor condemn him, but by lawful judgment of his Peers, or by the xref
href="http://en.wikipedia.org/wiki/Law_of_the_land" format="html" scope="external">Law of the land
We will sell to no man, we will not deny or defer to any man either Justice or Right.
```

By default, XML considers a single whitespace between words to be significant, and all other whitespace to be insignificant. Thus the paragraph above could be written all on one line with no spaces between the start tag and the first word or between the last word and the end tag and the XML parser would see it as exactly the same paragraph. Removing the insignificant space in markup like this is called *normalizing space*.

In some cases, all the spaces inside an element should be treated as significant. For example, in a code sample:

```
<codeblock>
class HelloWorld
{
   public static void main(String args[])
   {
      System.out.println("Hello World");
   }
}
</codeblock>
```

Here every whitespace character between the codeblock tags should be treated as significant.

How Oxygen XML Developer plugin determines when whitespace is significant

When Oxygen XML Developer plugin formats and indents an XML document, it introduces or removes insignificant whitespace to produce a layout with reasonable line lengths and elements indented to show their place in the hierarchy of the document. To correctly format and indent the XML source, Oxygen XML Developer plugin needs to know when to treat whitespace as significant and when to treat it as insignificant. However it is not always possible to tell this from the XML source file alone. To determine what whitespace is significant, Oxygen XML Developer plugin assigns each element in the document to one of four categories:

Ignore space

In the ignore space category, all whitespace is considered insignificant. This generally applies to content that consists only of elements nested inside other elements, with no text content.

Normalize space

In the normalize space category, a single whitespace character between character strings is considered significant and all other spaces are considered insignificant. This generally applies to elements that contain text content only. This content can be normalized by removing insignificant whitespace. Insignificant whitespace may then be added to format and indent the content.

Mixed content

In the mixed content category, a single whitespace between text characters is considered significant and all other spaces are considered insignificant. However,

 Whitespace between two child elements embedded in the text is normalized to a single space (rather than to zero spaces as would normally be the case for a text node with only whitespace characters, or the space between elements generally). • The lack of whitespace between a child element embedded in the text and either adjacent text or another child element is considered significant. That is, no whitespace can be introduced here when formatting and indenting the file.

For example:

```
The file is located in <i>HOME</i>/<i>USER</i>/hello. This is s <strong>big</strong>emphasis>deal</emphasis>.
```

In this example, whitespace should not be introduced around the i tags as it would introduce extra significant whitespace into the document. The space between the end tag and the beginning <emphasis> tag should be normalized to a single space, not zero spaces.

Preserve space

In the preserve space category, all whitespace in the element is regarded as significant. No changes are made to the spaces in elements in this category. Note, however, that child elements may be in a different category, and may be treated differently.

Attribute values are always in the preserve space category. The spaces between attributes in an element tag are always in the default space category.

Oxygen XML Developer plugin consults several pieces of information to assign an element to one of these categories. An element is always assigned to the most restrictive category (from Ignore to Preserve) that it is assigned to by any of the sources Oxygen XML Developer plugin consults. For instance, if the element is named on the **Default elements** list (as described below) but it has an xml:space="preserve" attribute in the source file, it will be assigned to the preserve space category. If an element has the xml:space="default" attribute in the source, but is listed on the **Mixed content** elements list, it will be assigned to the mixed content category.

To assign elements to these categories, Oxygen XML Developer plugin consults information from the following sources:

xml:space

If the XML element contains the xml:space attribute, the element is promoted to the appropriate category based on the value of the attribute.

Schema aware formatting

If a schema is available for the XML document, Oxygen XML Developer plugin can use information from the schema to promote the element to the appropriate category. For example:

- If the schema declares an element to be of type xs:string, the element will be promoted to the preserve space category because the string built-in type has the whitespace facet with the value preserve.
- If the schema declares an element to be mixed content, it will be promoted to the mixed content category.

Schema aware formatting can be turned on and off.

To turn it on or off for the Text editing mode ,open the Preferences dialog box and go to Editor > Format > XML > Schema aware format and indent.

Preserve space elements list

If an element is listed in the **Preserve space** list in the *XML formatting preferences*, it is promoted to the preserve space category.

Default space elements list

If an element is listed in the **Default space** list in the *XML formatting preferences*, it is promoted to the default space category

Mixed content elements list

If an element is listed in the **Mixed content** list in the *XML formatting preferences*, it is promoted to the mixed content category.

Element content

If an element contains mixed content, that is, a mix of text and other elements, it is promoted to the mixed content category. (Note that, in accordance with these rules, this happens even if the schema declares the element to have element only content.)

If an element contains text content, it is promoted to the default space category.

Text node content

If a text node contains any non-whitespace characters then the text node is promoted to the normalize space category.

How Oxygen XML Developer plugin formats and indents XML

You can control how Oxygen XML Developer plugin formats and indents XML documents. This can be particularly important if you store your XML document in a version control system, as it allows you to limit the number of trivial changes in spacing between versions of an XML document. The following settings pages control how XML documents are formatted:

- Format Preferences on page 555
- XML Formatting Preferences on page 556
- Whitespaces Preferences on page 558

When Oxygen XML Developer plugin formats and indents XML

Oxygen XML Developer plugin formats and indents a document, or part of it, on the following occasions:

- In text mode when you select one of the format and indent options (Document > Source > Format and Indent,
 Document > Source > Indent Selection, or Document > Source > Format and Indent Element).
- When saving documents in **Design** mode.
- When switching from **Design** mode to another mode.
- When saving or switching to Text mode from Grid mode, if the option Editor / Edit modes / Grid / Format and indent when passing from grid to text or on save is selected.

Setting an Indent Size to Zero

Oxygen XML Developer plugin will automatically *format and indent* documents at certain times. This includes indenting the content from the margin to reflect its structure. In some cases you may not want your content indented. To avoid your content being indented, you can set an indent size of zero.

Note: Changing the indent size does not override the rules that Oxygen XML Developer plugin uses for handling whitespace when formatting and indenting XML documents. Indents in elements that require whitespace to be maintained will not have their indent changed by these settings.

There are two cases to consider.

Maintaining zero indent in documents with zero indent

If you have existing documents with zero indent and you want Oxygen XML Developer plugin to maintain a zero indent when editing or formatting those documents:

- **1.** Open the **Preferences** dialog box and go to **Editor** > **Format**.
- 2. Select **Detect indent on open**.
- 3. Select Use zero-indent if detected.

Oxygen XML Developer plugin will examine the indent of each document as it is opened and if the indent is zero for all lines, or for nearly all lines, a zero indent will be used when formatting and indenting the document. Otherwise, Oxygen XML Developer plugin will use the indent closest to what it detects in the document.

Enforcing zero indent for all documents

If you want all documents to be formatted with zero indent, regardless of their current indenting:

1. Open the **Preferences** dialog box and go to **Editor** > **Format**.

- 2. Deselect Detect indent on open.
- 3. Set **Indent size** to 0.

All documents will be formatted and indented with an indent of zero.

Warning: Setting the indent size to zero can change the meaning of some file types, such as Python source files.

Format and Indent (Pretty Print) Multiple Files

Oxygen XML Developer plugin provides support for formatting and indenting (*pretty printing*) multiple files at once. This action is available for any document in XML format, as well as for XQuery, CSS, JavaScript, and JSON documents.

To format and indent multiple files, use the **Format and Indent Files** action that is available in the contextual menu of the **Navigator** view. This opens the **Format and Indent Files** dialog box that allows you to configure options for the action.

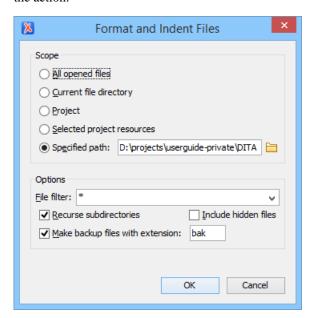

Figure 36: The Format and Indent Files Dialog Box

The **Scope** section allows you choose from the following scopes:

- All opened files The *pretty print* is performed in all opened files.
- **Directory of the current file** All the files in the folder of the current edited file.
- **Project files** All files from the current project.
- Selected project files The selected files from the current project.
- **Specified path** *Pretty prints* the files located at a specified path.

The **Options** section includes the following options:

- **File filter** Allow you to filter the files from the selected scope.
- **Recurse subdirectories** When enabled, the *pretty print* is performed recursively for the specified scope. The one exception is that this option is ignored if the scope is set to **All opened files**.
- **Include hidden files** When enabled, the *pretty print* is also performed in the hidden files.
- Make backup files with extension When enabled, Oxygen XML Developer plugin makes backup files of the
 modified files. The default extension is .bak, but you can change the extension as you prefer.

While working with XML documents you often have frequent changes to the structure and content. You are often faced with a situation where you need to make a slight change in multiple places in the same document. Oxygen XML Developer plugin includes a feature, **Manage Highlighted Content**, that is designed to help you achieve this.

When you are in **Text** mode and you perform a search operation or apply an XPath that highlights more than one result, you can select the **Manage Highlighted Content** action from the contextual menu of any highlight in the document, and the following options are available in its submenu:

Modify All - Use this option to modify (in-place) all the occurrences of the selected content. When you use this
option, a thin rectangle replaces the highlights and allows you to start editing. If matches with different letter cases
are found, a dialog box is displayed that allows you select whether you want to modify only matches with the same
letter case or all matches.

Note: If you select a very large number of highlights that you want to modify using this feature, a dialog box informs you that you may experience performance issues. You have the option to either use the **Find/Replace** operation, or continue the operation.

- **Surround All** Use this option to surround the highlighted content with a specific tag. This option opens the **Tag** dialog box. The **Specify the tag** drop-down menu presents all the available elements that you can choose from.
- **Remove All** Removes all the highlighted content.

If you right-click content in another part of the document, other than a highlight, you have the option to select the following option:

• Modify All Matches - Use this option to modify (in-place) all the occurrences of the selected content (or the contiguous fragment in which the cursor is located). When you use this option, a thin rectangle replaces the highlights and allows you to start editing. If matches with different letter cases are found, a dialog box is displayed that allows you select whether you want to modify only matches with the same letter case or all matches.

Editing XML Documents in Grid Mode

This section includes features and actions for editing XML documents in the **Grid** mode of Oxygen XML Developer plugin.

Editing Actions in Grid Mode

In order to access these actions, you can click the column header and choose the **Table** item from the contextual menu. The same set of actions is available in the **Document** menu and on the **Grid** toolbar which is opened from menu **Window** > **Show Toolbar** > **Grid**.

Sorting a Table Column

You can sort certain table columns by using the Sort ascending or Sort descending actions that are available on the **Grid** toolbar or from the contextual menu.

The sorting result depends on the data type of the column content. It can be different in case of number (numerical sorting) or text information (alphabetical sorting). The editor automatically analyzes the content and decides what type of sorting to apply. When a mixed set of values is present in the sorted column, a dialog box is displayed that allows you to choose the desired type of sorting between *numerical* and *alphabetical*.

Inserting a Row in a Table

You can add a new row using the **Copy/Paste** actions, or by selecting **Insert row** from the contextual menu or the **Grid** toolbar.

For a faster way to insert a new row, move the selection over the row header, and then press **Enter**. The row header is the zone in the left of the row that holds the row number. The new row is inserted below the selection.

Inserting a Column in a Table

You can insert a column after the selected column by using the Insert column action from the contextual menu or the Grid toolbar.

Clearing the Content of a Column

You can clear all the cells from a column by using the **Clear content** action from the contextual menu.

Adding Nodes

You can add nodes before, after, or as a child of the currently selected node by using the various actions in the following submenus of the contextual menu:

- **Insert before** Offers a list of valid nodes, depending on the context, and inserts your selection before the currently selected node, as a sibling.
- **Insert after** Offers a list of valid nodes, depending on the context, and inserts your selection after the currently selected node, as a sibling.
- **Append child** Offers a list of valid nodes, depending on the context, and appends your selection as a child of the currently selected node.

Duplicating Nodes

You can quickly create new nodes by duplicating existing ones. The **Duplicate** action is available in the contextual menu and in the **Document** > **Grid Edit** menu.

Refresh Layout

When using drag and drop to reorganize the document, the resulting layout can be different from the expected one. For instance, the layout can contain a set of sibling tables that can be joined together. To force the layout to be recomputed, you can use the **C** Refresh selected action that is available in the contextual menu and in the **Document** > Grid Edit menu.

Start and Stop Editing a Cell Value

To edit the value of a cell, simply select the grid cell and press (Enter).

To stop editing a cell value, press (Enter) again.

To cancel the editing without saving the current changes in the document, press the (Esc) key.

Drag and Drop in the Grid Editor

You are able to easily arrange different sections in your XML document in the **Grid** mode by using drag and drop actions.

You can do the following with drag and drop:

- Copy or move a set of nodes.
- Change the order of columns in the tables.
- Move the rows from the tables.

These operations are available for both single and multiple selections. To deselect one of the selected fragments, use **Ctrl Single-Click (Command Single-Click on OS X)**.

While dragging, the editor paints guide-lines showing the locations where you can drop the nodes. You can also drag nodes outside the **Grid** editor and text from other applications into the **Grid**. For more information, see *Copy and Paste in the Grid Editor*.

Copy and Paste in the Grid Editor

The selection in the **Grid** mode is a bit complex compared to the selection in a text component. It consists of a current selected cell and additional selected cells. These additional cells are either selected with the cursor, or implied by the currently selected cell. To be more specific, consider that you click the name of the column (this becomes the current

selected cell), but the editor automatically extends the selection so that it contains all the cells from that column. The current selected cell is painted with a color that is different from the rest of the selection.

You can select discontinuous regions of nodes and place them in the clipboard using the copy action. To deselect one of the selected fragments, use Ctrl Single-Click (Command Single-Click on OS X). Pasting these nodes relative to the current selected cell may be done in two ways: just below (after) as a brother, which is the default behavior, or as the last child of the selected cell.

The Paste as Child action is available in the contextual menu.

The nodes copied from the **Grid** editor can also be pasted into the **Text** editor or other applications. When copying from the **Grid** into the **Text** editor or other text based applications, the inserted string represents the nodes serialization. The nodes from tables can be copied using HTML or RTF in table format. The resulting cells contain only the concatenated values of the text nodes.

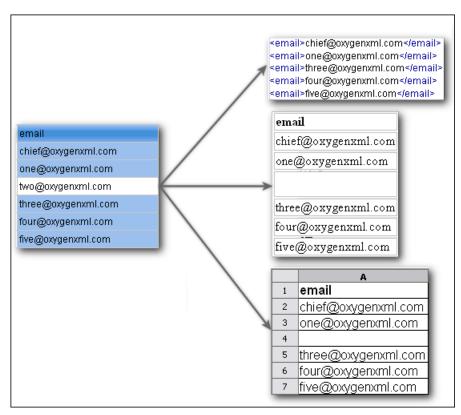

Figure 37: Copying from Grid to Other Editors

In the **Grid** editor you can paste well-formed XML content or tab separated values from other editors. If you paste XML content, the result will be the insertion of the nodes obtained by parsing this content.

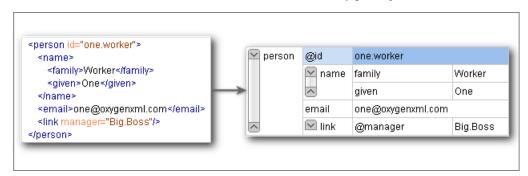

Figure 38: Copying XML Data into Grid

If the pasted text contains multiple lines of tab separated values it can be considered as a matrix of values. By pasting this matrix of values into the **Grid** editor the result will be a matrix of cells. If the operation is performed inside existing cells, the existing values will be overwritten and new cells will be created when needed. This is useful, for example, when trying to transfer data from Excel like editors into the **Grid** editor.

Associate a Schema to a Document

This section explains the methods of associating a schema to a document for validation and content completion purposes.

Setting a Schema for Content Completion

This section explains the available methods of setting a schema for content completion in an XML document edited in Oxygen XML Developer plugin.

Supported Schema Types for XML Documents

The supported schema types are:

- W3C XML Schema 1.0 and 1.1 (with and without embedded Schematron rules);
- DTD;
- Relax NG XML syntax (with and without embedded Schematron rules);
- Relax NG compact syntax;
- NVDL;
- Schematron (both ISO Schematron and Schematron 1.5).

Setting a Default Schema

When trying to detect a schema, Oxygen XML Developer plugin searches in multiple locations, in the exact following order:

- The *validation scenario* associated with the document.
- The validation scenario associated with the document type (if defined).
- The document schema declaration.
- The document type schema definition. Each document type available in **Document Type Association** preferences page contains a set of rules for associating a schema with the current document.

The schema has one of the following types: XML Schema, XML Schema with embedded Schematron rules, Relax NG (XML syntax or compact syntax), Relax NG (XML syntax) with embedded Schematron rules, Schematron, DTD, NVDL.

The rules are applied in the order they appear in the table and take into account the local name of the root element, the default namespace and the file name of the document.

Important:

The editor is creating the content completion lists by analysing the specified schema and the current context (the position in the editor). If you change the schema, then the list of tags to be inserted is updated.

Making the Schema Association Explicit in the XML Instance Document

The schema used by the Content Completion Assistant and document validation engine can be associated with the document using the ** Associate Schema action. For most of the schema types, it uses the xml-model processing instruction, the exceptions being:

- W3C XML Schema The xsi:schemaLocation attribute is used.
- **DTD** The DOCTYPE declaration is used.

The association can specify a relative file path or a URL of the schema. The advantage of relative file path is that you can configure the schema at file level instead of document type level.

Select the ** Associate schema action from the Document > Schema menu or the Document toolbar to select the schema that will be associated with the XML document. The **Associate Schema** dialog box is displayed:

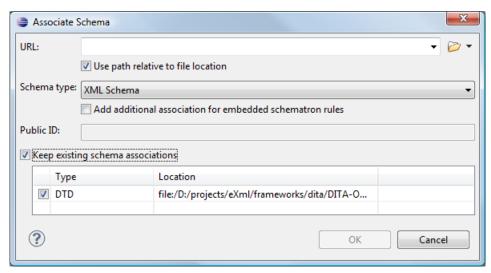

Figure 41: The Associate Schema Dialog Box

The available options are:

URL - Contains a predefined set of schemas that are used more often and it also keeps a history of the last used schemas. The URL must point to the schema file which can be loaded from the local disk or from a remote server through HTTP(S), FTP(S).

- Schema type Selected automatically from the list of possible types in the Schema type combo box (XML Schema, DTD, Relax NG, Relax NG Compact, Schematron, NVDL) based on the extension of the schema file that was entered in the URL field.
- **Public ID** Specify a public ID if you have selected a DTD.
- Add additional association for embedded schematron rules If you have selected XML Schema or Relax NG schemas with embedded Schematron rules, enable this option.
- Use path relative to file location Enable this option if the XML instance document and the associated schema contain relative paths. The location of the schema file is inserted in the XML instance document as a relative file path. This practice allows you, for example, to share these documents with other users, without running into problems caused by different project locations on physical disk.
- **Keep existing schema associations** Enable this option to keep the associations of the currently edited document with a Schema when you associate a new one.

The association with an XML Schema is added as an attribute of the root element. The **Associate schema** action adds one of the following:

- xsi:schemaLocation attribute, if the root element of the document sets a default namespace with an xmlns attribute.
- xsi:noNamespaceSchemaLocation attribute, if the root element does not set a default namespace.

The association with a DTD is added as a DOCTYPE declaration. The association with a Relax NG, Schematron or NVDL schema is added as xml-model processing instruction.

Associating a Schema With the Namespace of the Root Element

The namespace of the root element of an XML document can be associated with an XML Schema using an XML catalog. If there is no xsi:schemaLocation attribute on the root element and the XML document is not matched with a document type, the namespace of the root element is searched in the XML catalogs set in Preferences.

If the XML catalog contains an uri or rewriteUri or delegateUri element, its schema will be used by the application to drive the *content completion* and document *validation*.

The xml-model Processing Instruction

The xml-model processing instruction associates a schema with the XML document that contains the processing instruction. It must be added at the beginning of the document, just after the XML prologue. The following code snippet contains an xml-model processing instruction declaration:

```
<?xml-model href="../schema.sch" type="application/xml" schematypens="http://purl.oclc.org/dsdl/schematron"
phase="ALL" title="Main schema"?>
```

It is available in the *Content Completion Assistant*, before XML document root element, and includes the following attributes:

- href (required) The schema file location.
- type The content type of the schema. This is an optional attribute with the following possible values for each specified type:
 - DTD The recommended value is application/xml-dtd.
 - W3C XML Schema The recommended value is application/xml, or can be left unspecified.
 - RELAX NG XML Syntax The recommended value is application/xml, or can be left unspecified.
 - RELAX NG Compact Syntax The recommended value is application/relax-ng-compact-syntax.
 - Schematron The recommended value is application/xml, or can be left unspecified.
 - NVDL The recommended value is application/xml, or can be left unspecified.
- schematypens The namespace for the schema language of the referenced schema with the following possible values:
 - DTD Not specified.
 - W3C XML Schema The recommended value is http://www.w3.org/2001/XMLSchema.
 - RELAX NG XML Syntax The recommended value is http://relaxng.org/ns/structure/1.0.

- RELAX NG Compact Syntax Not specified.
- Schematron The recommended value is http://purl.oclc.org/dsdl/schematron.
- NVDL The recommended value is http://purl.oclc.org/dsdl/nvdl/ns/structure/1.0.
- phase The phase name for the validation function in Schematron schema. This is an optional attribute. To run all phases from the Schematron, use the special #ALL value. If the phase is not specified, the default phase that is configured in the Schematron will be applied.
- title The title for the associated schema. This is an optional attribute.

Older versions of Oxygen XML Developer plugin used the oxygen processing instruction with the following attributes:

- RNGSchema Specifies the path to the Relax NG schema that is associated with the current document.
- type Specifies the type of Relax NG schema. It is used along with the RNGSchema attribute and can have the value xml or compact.
- NVDLSchema Specifies the path to the NVDL schema that is associated with the current document.
- SCHSchema Specifies the path to the SCH schema that is associated with the current document.

Note: Documents that use the oxygen processing instruction are compatible with newer versions of Oxygen XML Developer plugin.

Learning Document Structure

When working with documents that do not specify a schema, or for which the schema is not known or does not exist, Oxygen XML Developer plugin is able to learn and translate the document structure to a DTD. You can choose to save the learned structure to a file in order to provide a DTD as an initialization source for *content completion* and *document validation*. This feature is also useful for producing DTD's for documents containing personal or custom element types.

When you open a document that is not associated with a schema, Oxygen XML Developer plugin automatically learns the document structure and uses it for *content completion*. To disable this feature you have to uncheck the checkbox *Learn on open document* in the user preferences.

Create a DTD from Learned Document Structure

When there is no schema associated with an XML document, Oxygen XML Developer plugin can learn the document structure by parsing the document internally. This feature is enabled with *the option Learn on open document* that is available in the user preferences.

To create a DTD from the learned structure:

- 1. Open the XML document for which a DTD will be created.
- 2. Go to XML > Learn Structure (<u>Ctrl Shift L (Meta Shift L on OS X)</u>). The Learn Structure action reads the mark-up structure of the current document. The Learn completed message is displayed in the application's status bar when the action is finished.
- 3. Go to XML > Save Structure (Ctrl Shift S (Meta Shift S on OS X)) and enter the DTD file path.
- **4.** Press the *Save* button.

Content Completion Assistant

The intelligent **Content Completion Assistant** available in Oxygen XML Developer plugin enables rapid, in-line identification and insertion of structured language elements, attributes and, in some cases, their parameter options.

Figure 42: Content Completion Assistant

The functioning of the Content Completion Assistant feature is schema-driven (XML Schema, DTD, and RELAX NG). When Oxygen XML Developer plugin detects a schema, it logs its URL in the *Status view*.

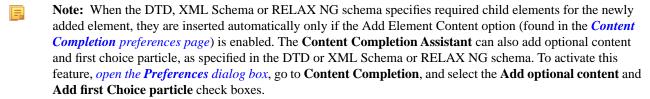

The Content Completion Assistant is enabled by default. To disable it, open the Preferences dialog box and go to **Editor** > **Content Completion**. It is activated:

- Automatically, after a configurable delay from the last key press of the < character. You can adjust the delay from the Content Completion preferences page.
- On demand, by pressing Ctrl Space (Command Space on OS X) on a partial element or attribute name.
 - Note: If the Content Completion list contains only one valid proposal, when you press the <u>Ctrl Space</u> (Command Space on OS X) shortcut key, the proposal is automatically inserted.

When active, it displays a list of context-sensitive proposals valid at the current cursor position. Elements are selected in the list using the Up and Down cursor keys on your keyboard. For each selected item in the list, the Content Completion Assistant displays a documentation window. You can customize the size of the documentation window by dragging its top, right, and bottom borders.

To insert the selected content, do one of the following:

- Press Enter or Tab key on your keyboard to insert both the start and end tags. The cursor is positioned inside the start tag, in a position suitable for inserting attributes.
- Press Ctrl Enter (Meta Enter on OS X) on your keyboard. Oxygen XML Developer plugin inserts both the start and end tags and positions the cursor between the tags, so you can start typing content.

After inserting an element, the cursor is positioned:

- Before the > character of the start tag, if the element allows attributes, in order to enable rapid insertion of any of the attributes supported by the element. Pressing the space bar displays the Content Completion list once again. This time it contains the list of allowed attribute names. If the attribute supports a fixed set of parameters, the assistant list displays the list of valid parameters. If the parameter setting is user-defined and therefore variable, the assistant is closed to enable manual insertion. The values of the attributes can be learned from the same elements in the current document
- After the > character of the start tag if the element has no attributes.

The **Content Completion Assistant** is displayed:

- Anywhere within a tag name or at the beginning of a tag name in an XML document, XML Schema, DTD, or Relax NG (full or compact syntax) schema
- Anywhere within an attribute name or at the beginning of an attribute name in any XML document with an associated schema
- Within attribute values or at the beginning of attribute values in XML documents where lists of possible values have been defined for that element in the schema associated with the document.

The items that populate the **Content Completion Assistant** depend on the element structure specified in the DTD, XML Schema, Relax NG (full or compact syntax) schema, or NVDL schema associated with the edited document.

Note: The **Content Completion Assistant** is able to offer elements defined both by XML Schemas version 1.0 and 1.1.

The number and type of elements displayed by the **Content Completion Assistant** is dependent on the cursor's current position in the structured document. The child elements displayed within a given element are defined by the structure of the specified DTD, XML Schema, Relax NG (full or compact syntax) schema, or NVDL schema.

If the **Content Completion Assistant** proposals list contains only one element, the list is not displayed. When you trigger the **Content Completion Assistant**, the element is inserted automatically at the cursor position.

A schema may declare certain attributes as *ID* or *IDREF/IDREFS*. When the document is validated, Oxygen XML Developer plugin checks the uniqueness and correctness of the ID attributes. It also collects the attribute values declared in the document to prepare the **Content Completion Assistant**'s list of proposals. This is available for documents that use DTD, XML Schema, and Relax NG schema.

Also, values of all the *xml:id* attributes are handled as ID attributes. They are collected and displayed by the **Content Completion Assistant** as possible values for *anyURI* attributes defined in the schema of the edited document. This works only for XML Schema and Relax NG schemas.

For documents that use an XML Schema or Relax NG schema, the content assistant offers proposals for attributes and elements values that have as type an enumeration of tokens. Also, if a default value or a fixed value is defined in the XML Schema used in validation for an attribute or element, then that value is offered in the **Content Completion Assistant** window.

Set Schema for Content Completion

The DTD, XML Schema, Relax NG, or NVDL schema used to populate the **Content Completion Assistant** is specified in the following methods, in order of precedence:

- The schema specified explicitly in the document. In this case Oxygen XML Developer plugin reads the beginning of the document and resolves the location of the DTD, XML Schema, Relax NG schema, or NVDL schema.
- The default schema declared in the **Document Type** configuration dialog box that matches the edited document.
- For XSLT stylesheets, the schema specified in the Oxygen XML Developer plugin Content Completion options. Oxygen
 XML Developer plugin will read the Content Completion settings when the prolog fails to provide or resolve the
 location of a DTD, XML Schema, Relax NG or NVDL schema.
- For XML Schemas, the schema specified in the Oxygen XML Developer plugin *Content Completion options*. Oxygen XML Developer plugin will read the Content Completion settings and the specified schema will enhance the content completion inside the xs:annotation/xs:appinfo elements of the XML Schema.

Content Completion in Documents with Relax NG Schemas

Inside the documents that use a Relax NG schema, the **Content Completion Assistant** is able to present element values if such values are specified in the Relax NG schema. Also in Relax NG documents the **Content Completion Assistant** presents additional values of type ID for an *anyURI* data type. It presents also pattern names defined in the Relax NG schema as possible values for pattern references. For example if the schema defines an enumValuesElem element like:

<element name="enumValuesElem">
 <choice>
 <value>value1</value>
 <value>value2</value>

```
<value>value3</value>
    </choice>
</element>
```

In documents based on this schema, the **Content Completion Assistant** offers the following list of values:

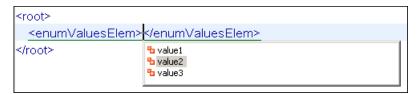

Figure 43: Content Completion assistant - element values in Relax NG documents

Schema Annotations

A schema annotation is a documentation snippet associated with the definition of an element or attribute in a schema. If such a schema is associated with an XML document, the annotations are displayed in:

- The Content Completion Assistant.
- A small tooltip window shown when the mouse hovers over an element or attribute.

The schema annotations support is available the schema type is one of the following: XML Schema, Relax NG, NVDL, or DTD. If you want to turn off this feature, disable the Show annotations in Content Completion Assistant option.

Styling Annotations with HTML

You can use HTML format in the annotations you add in an XML Schema or Relax NG schema. This improves the visual appearance and readability of the documentation window displayed when editing XML documents validated against such a schema. An annotation is recognized and displayed as HTML if it contains at least one HTML element, like: div, body, p, br, table, ul, or ol.

The HTML rendering is controlled by the **Show annotations using HTML format, if possible** option. When this options is disabled, the annotations are converted and displayed as plain text. If the annotation contains one or more HTML tags (p, br, ul, li), they are rendered as an HTML document loaded in a web browser: p begins a new paragraph, br breaks the current line, u1 encloses a list of items, 1i encloses an item of the list.

Collecting Annotations from XML Schemas

In an XML Schema the annotations are specified in an <xs: annotation> element like this:

```
<xs:annotation>
  <xs:documentation>
           Description of the element.
  </xs:documentation>
</xs:annotation>
```

For XML Schema, if an element or attribute does not have a specific annotation, then Oxygen XML Developer plugin looks for an annotation in the type definition of that element or attribute.

Collecting Annotations from Relax NG Schemas

For Relax NG schema element / attribute annotation are made using the <documentation> element from the http://relaxng.org/ns/compatibility/annotations/1.0 namespace. However, any element outside the Relax NG namespace (http://relaxng.org/ns/structure/1.0) is handled as annotation and the text content is displayed in the annotation window. To activate this behavior, enable the *Use all Relax NG annotations as* documentation option.

Collecting Annotation from DTDs

For DTD Oxygen XML Developer plugin defines a custom mechanism for annotation using comments enabled from the option *Use DTD comments as annotations*. Following is an example of a DTD annotation:

```
<!--doc:Description of the element. -->
```

Content Completion Helper Views

Information about the current element being edited is also available in various views, such as the **Model** view, **Attributes** view, **Elements** view, and **Entities** view. By default, they are located on the right-hand side of the main editor window. These views, along with the powerful **Outline** view, provide spatial and insight information about the edited document and the current element.

The Model View

The **Model** view presents the structure of the currently selected tag, and its documentation, defined as annotation in the schema of the current document. To open the **Model** view, select it from the **Window** > **Show View** > **Other** > **Oxygen XML Developer plugin** menu.

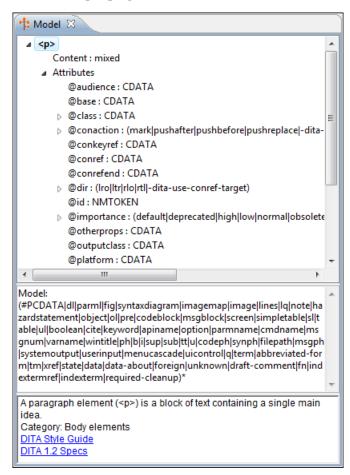

Figure 44: The Model View

The Model view is comprised of two sections, an element structure panel and an annotations panel.

Element Structure Panel

The element structure panel displays the structure of the currently edited or selected tag in a tree-like format. The information includes the name, model, and attributes of the current tag. The allowed attributes are shown along with imposed restrictions, if any.

Figure 45: The Element Structure Panel

Annotation Panel

The **Annotation** panel displays the annotation information for the currently selected element. This information is collected from the XML schema.

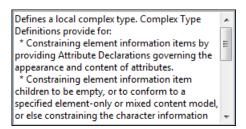

Figure 46: The Annotation panel

The Attributes View

The **Attributes** view presents all the attributes of the current element determined by the schema of the document.

You can use the **Attributes** view to insert attributes, edit their values, or add values to existing attributes.

The attributes are rendered differently depending on their state:

- The names of the attributes with a specified value are rendered with a bold font, and their value with a plain font.
 - Note: The names of the attributes with an empty string value are also rendered bold.
- Default values are rendered with a plain font, painted gray.
- Empty values display the text "[empty]", painted gray.
- Invalid attributes and values are painted red.

Double-click a cell in the **Value** column to edit the value of the corresponding attribute. If the possible values of the attribute are specified as list in the schema of the edited document, the **Value** column acts as a combo box that allows you to insert the values in the document.

You can sort the attributes table by clicking the **Attribute** column header. The table contents can be sorted as follows:

- By attribute name in ascending order.
- By attribute name in descending order.
- Custom order, where the used attributes are displayed at the beginning of the table sorted in ascending order, followed by the rest of the allowed elements sorted in ascending order.

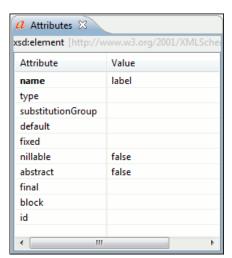

Figure 47: The Attributes View

Contextual Menu Actions in the Attributes View

The following actions are available in the contextual menu of the **Attributes** view when editing in **Text** mode:

Add

Allows you to insert a new attribute.

Set empty value

Specifies the current attribute value as empty.

Remove

Removes the attribute (action available only if the attribute is specified). You can invoke this action by pressing the (**Delete**) or (**Backspace**) keys.

Copy

Copies the attrName="attrValue" pair to the clipboard. The attrValue can be:

- The value of the attribute.
- The value of the default attribute, if the attribute does not appear in the edited document.
- Empty, if the attribute does not appear in the edited document and has no default value set.

Paste

Depending on the content of the clipboard, the following cases are possible:

- If the clipboard contains an attribute and its value, both of them are introduced in the **Attributes** view. The attribute is selected and its value is changed if they exist in the **Attributes** view.
- If the clipboard contains an attribute name with an empty value, the attribute is introduced in the **Attributes** view and you can start editing it. The attribute is selected and you can start editing it if it exists in the **Attributes** view.
- If the clipboard only contains text, the value of the selected attribute is modified.

The Elements View

The **Elements** view presents a list of all defined elements that you can insert at the current cursor position according to the schema associated to the document. Double-clicking any of the listed elements inserts that element in the edited document. All elements from a sequence are presented but the invalid proposals (which cannot be inserted in the current context) are disabled and rendered in gray.

Figure 48: The Elements View

The Entities View

This view displays a list with all entities declared in the current document, as well as built-in ones. Double-clicking one of the entities will insert it at the current cursor position. You can also sort entities by name and value by clicking the column headers.

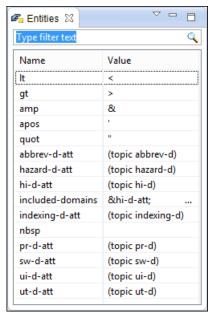

Figure 49: The Entities View

The view features a filtering capability that allows you to search an entity by name, value, or both. Also, you can choose to display the internal or external entities.

Note: When entering filters, you can use the ? and * wildcards. Also, you can enter multiple filters by separating them with a comma.

Code Templates

Code templates are code fragments that can be inserted quickly at the current editing position. Oxygen XML Developer plugin comes with a set of built-in code templates for CSS, LESS, Schematron, XSL, XQuery, and XML Schema document types. You can also *define you own code templates and share them with others*.

To get a complete list of available code templates, press <u>Ctrl Shift Space</u> in <u>Text</u> mode. To enter the code template, select it from the list or type its code and press <u>Enter</u>. If a shortcut key has been assigned to the code template, you can also use the shortcut key to enter it. Code templates are displayed with a <u>st</u> symbol in the content completion list.

When the **Content Completion Assistant** is invoked (**Ctrl Space (Command Space on OS X)** in **Text** mode or **Enter** in **Author** mode), it also presents a list of code templates specific to the type of the active editor.

To watch our video demonstration about code templates, go to http://oxygenxml.com/demo/Code_Templates.html.

Configuring the Proposals in the Content Completion Assistant

Oxygen XML Developer plugin gathers information from the associated schemas (DTDs, XML Schema, RelaxNG) to determine the proposals that appear in the **Content Completion Assistant**. Oxygen XML Developer plugin also includes support that allows you to configure the possible attribute or element values for the proposals. To do so, a configuration file can be used, along with the associated schema, to add or replace possible values for attributes or elements that are proposed in the **Content Completion Assistant**. An example of a specific use-case is if you want the **Content Completion Assistant** to propose several possible values for the language code whenever you use an xml:lang attribute.

To configure content completion proposals, follow these steps:

- 1. Create a new resources folder (if it does not already exist) in the frameworks directory for the document type. For instance: OXYGEN_INSTALL_DIR/frameworks/dita/resources.
- **2.** Open the **Preferences** dialog box and go to **Document Type Association**. Edit the document type configuration for your XML vocabulary, and in the **Classpath** tab add a link to that resources folder.
- **3.** Use the **New** document wizard to create a configuration file using the **Content Completion Configuration** file template.
- **4.** Make the appropriate changes to your custom configuration file. The file template includes details about how each element and attribute is used in the configuration file.
- 5. Save the file in the resources folder, using the fixed name: cc_value_config.xml.
- Re-open the application and open an XML document. In the Content Completion Assistant you should see your customizations.

The Configuration File

The configuration file is composed of a series of match instructions that will match either an element or an attribute name. A new value is specified inside one or more item elements, which are grouped inside an items element. The behavior of the items element is specified with the help of the action attribute, which can have any of the following values:

- append Adds new values to appear in the proposals list (default value).
- addIfEmpty Adds new values to the proposals list, only if no other values are contributed by the schema.
- replace Replaces the values contributed by the schema with new values to appear in the proposals list.

The values in the configuration file can be specified either directly or by calling an external XSLT file that will extract data from any external source.

Example - Specifying Values Directly

Example - Calling an External XSLT Script

```
<xslt href="../xsl/get_values_from_db.xsl" useCache="false" action="replace"/>
```

In this example, the get_values_from_db.xsl is executed in order to extract values from a database.

Note: A comprehensive XSLT sample is included in the Content Completion Configuration file template.

Configuring Proposals in the Context for which the Content Completion was Invoked

A more complex scenario for configuring the content completion proposals would be if you want to choose the possible values to provide, depending on the context of the element in which the content completion was invoked.

Suppose that you want to propose certain possible values for one property (for example, *color*) and other values for another property (for example, *shape*). If the property represents a color, then the values should represent applicable colors, while if the property represents a shape, then the values should represent applicable shapes. See the following code snippets:

Your main document:

The content completion configuration file:

        <item value='square'/>
      </xsl:if>
    </items>
  </xsl:template>
</xsl:stylesheet>
```

The contextElementXPathExpression parameter will be bound to an XPath expression that identifies the element in the context for which the content completion was invoked.

Validating XML Documents

The W3C XML specification states that a program should not continue to process an XML document if it finds a validation error. The reason is that XML software should be easy to write and all XML documents should be compatible. With HTML it is possible to create documents with lots of errors (for example, when you forget an end tag). One of the main reasons that various HTML browsers have performance and compatibility problems is that they have different methods of figuring out how to render a document when an HTML error is encountered. Using XML helps to eliminate such problems.

Even when creating XML documents, errors are very easily introduced. When working with large projects or a large number of files, the probability that errors will occur is even greater. Preventing and solving errors in your projects can

be time consuming and frustrating. Fortunately, Oxygen XML Developer plugin provides validation functions that enable you to easily identify errors and their location.

Checking XML Well-formedness

A Well-Formed XML document is a document that conforms to the XML syntax rules. A Namespace Well-Formed XML document is a document that is XML Well-Formed and is also namespace-wellformed and namespace-valid.

The XML Syntax rules for Well-Formed XML are:

- All XML elements must have a closing tag.
- XML tags are case-sensitive.
- All XML elements must be properly nested.
- All XML documents must have a root element.
- Attribute values must always be quoted.
- With XML, whitespace is preserved.

The namespace-wellformed rules are:

- All element and attribute names contain either zero or one colon.
- No entity names, processing instruction targets, or notation names contain any colons.

The namespace-valid rules are:

- The prefix *xml* is by definition bound to the namespace name *http://www.w3.org/XML/1998/namespace*. It MAY, but need not, be declared, and MUST NOT be undeclared or bound to any other namespace name. Other prefixes MUST NOT be bound to this namespace name.
- The prefix *xmlns* is used only to declare namespace bindings and is by definition bound to the namespace name http://www.w3.org/2000/xmlns/. It MUST NOT be declared or undeclared. Other prefixes MUST NOT be bound to this namespace name.
- All other prefixes beginning with the three-letter sequence *x*, *m*, *l*, in any case combination, are reserved. This means that users SHOULD NOT use them except as defined by later specifications and processors MUST NOT treat them as fatal errors
- The namespace prefix, unless it is *xml* or *xmlns*, MUST have been declared in a namespace declaration attribute in either the start-tag of the element where the prefix is used or in an ancestor element (for example, an element in whose content the prefixed markup occurs). Furthermore, the attribute value in the innermost such declaration MUST NOT be an empty string.

A not Well-Formed XML Document

<root><tag></root>

When **Check Well-Formedness** is performed the following error is raised:

The element type "tag" must be terminated by the matching end-tag "</tag>"

To resolve the error, click in the result list record which will locate and highlight the errors approximate position. Identify which start tag is missing an end tag and insert </tag>.

A not namespace-wellformed document

<x::y></x::y>

```
Element or attribute do not match QName production:
QName::=(NCName':')?NCName.
```

A not namespace-valid document

```
<x:y></x:y>
```

When **Check document form** is performed the following error is raised:

```
The prefix "x" for element "x:y" is not bound.
```

Also the selected files in the current project can be checked for well-formedness with a single action by selecting the **Check Well-Formedness** action from the **Validate** submenu when invoking the contextual menu in the **Navigator** view.

Validating XML Documents Against a Schema

A *Valid* XML document is a *Well-Formed* XML document that also conforms to the rules of a schema that defines the legal elements of an XML document. The schema type can be: XML Schema, Relax NG (full or compact syntax), Schematron, Document Type Definition (DTD), or Namespace-based Validation Dispatching Language (NVDL).

The purpose of the schema is to define the legal building blocks of an XML document. It defines the document structure with a list of legal elements.

The Validate function ensures that your document is compliant with the rules defined by an associated DTD, XML Schema, Relax NG, or Schematron schema. XML Schema or Relax NG Schema can embed Schematron rules. For Schematron validations you can select the validation phase.

Presenting Validation Errors in Text Mode

A line with a validation error or warning will be marked in the editor panel by underlining the error region with a red color. Also a red sign will mark the position in the document of that line on the right side ruler of the editor panel. The same will happen for a validation warning, but the color will be yellow instead of red. Hovering over a validation error presents a tooltip message with more details about the error and *possible quick fixes* (if available for that error or warning).

The ruler on the right side of the document is designed to display the errors and warnings found during the validation process and also to help you to locate them more easily. The ruler contains the following areas:

- Top area that contains a success validation indicator that will turn green if the validation succeeded, or red otherwise.
- Middle area where the error markers are depicted in red. To limit the number of markers shown *open the Preferences dialog box* and go to **Editor** > **Document checking** > **Maximum number of problems reported per document**.

Clicking a marker will highlight the corresponding text area in the editor. The error message is displayed both in the tool tip and in the error area on the bottom of the editor panel.

Status messages from every validation action are logged into the Console view.

If you want to see all the validation error messages *grouped in a view* you should use the **Validate** action from the **XML** menu or from the **Validation** toolbar drop-down menu. This action collects all error messages in the **Problems** view of the Eclipse platform if the validated file is in the current workspace or in a custom **Errors** view if the validated file is outside the workspace.

Customizing Assert Error Messages

To customize the error messages that the Xerces or Saxon validation engines display for the assert and assertion elements, set the message attribute on these elements. For Xerces, the message attribute has to belong to the http://xerces.apache.org namespace. For Saxon, the message attribute has to belong to the

http://saxon.sourceforge.net/namespace. The value of the message attribute is the error message displayed if the assertion fails.

Validation Example - A DocBook Validation Error

In the following DocBook 4 document the content of the listitem element does not match the rules of the DocBook 4 schema, that is docbookx.dtd.

The Validate Document action will return the following error:

```
Unexpected element "link". The content of the parent element type must match
"(calloutlist|glosslist|bibliolist|itemizedlist|orderedlist|segmentedlist|simplelist
|variablelist|caution|important|note|tip|warning|literallayout|programlisting
|programlistingco|screen|screenco|screenshot|synopsis|cmdsynopsis|funcsynopsis
|classsynopsis|fieldsynopsis|constructorsynopsis|destructorsynopsis|methodsynopsis
|formalpara|para|simpara|address|blockquote|graphic|graphico|mediaobject|mediaobjectco
|informalequation|informalexample|informalfigure|informaltable|equation|example|figure
|table|msgset|procedure|sidebar|qandaset|task|anchor|bridgehead|remark|highlights
|abstract|authorblurb|epigraph|indexterm|beginpage)+".
```

This error message is a little more difficult to understand, so understanding of the syntax or processing rules for the DocBook XML DTD's listitem element is recommended. However, the error message does give us a clue as to the source of the problem, indicating that "The content of element type must match".

Luckily most standards based DTDs, XML Schemas, and Relax NG schemas are supplied with reference documentation. This enables us to lookup the element and read about it. In this case you should learn about the child elements of listitem and their nesting rules. Once you have correctly inserted the required child element and nested it in accordance with the XML rules, the document will become valid on the next validation test.

Automatic Validation

Oxygen XML Developer plugin *can be configured* to mark validation errors in the document as you are editing. If you *enable the Automatic validation option*, all validation errors and warnings will be *highlighted automatically in the editor panel*. The automatic validation starts parsing the document and marking the errors after a *configurable delay* from the last key typed. Errors are highlighted with underline markers in the main editor panel and small rectangles on the right side ruler of the editor panel, *in the same way as for manual validation invoked by the user*. Hovering over a validation error presents a tooltip message with more details about the error.

Custom Validators

If you need to validate the edited document with a validation engine that is different from the built-in engine, you can configure external validators in the Oxygen XML Developer plugin preferences. After a custom validation engine is properly configured, it can be applied on the current document by selecting it from the list of custom validation engines in the 🗹 🕶 Validation toolbar drop-down menu. The document is validated against the schema declared in the document.

Some validators are configured by default but there are third party processors which do not support the *output message format* of Oxygen XML Developer plugin for linked messages:

LIBXML - Included in Oxygen XML Developer plugin (Windows edition only). It is associated to XML Editor. It is able to validate the edited document against XML Schema, Relax NG schema full syntax, internal DTD (included in the XML document) or a custom schema type. XML catalogs support (the --catalogs parameter) and XInclude processing (--xinclude) are enabled by default in the preconfigured LIBXML validator. The --postvalid parameter is also set by default which allows LIBXML to validate correctly the main document even if the XInclude fragments contain IDREFS to ID's located in other fragments.

For validation against an external DTD specified by URI in the XML document, add the --dtdvalid \${ds} parameter manually to the DTD validation command line. \${ds} represents the detected DTD declaration in the XML document.

Caution: File paths containing spaces are not handled correctly in the LIBXML processor. For example the built-in XML catalog files of the predefined document types (DocBook, TEI, DITA, etc) are not handled by LIBXML if Oxygen XML Developer plugin is installed in the default location on Windows (C:\Program Files) because the built-in XML catalog files are stored in the frameworks subfolder of the installation folder which in this case contains at least one space character in the file path.

(1)

Attention: On OS X if the full path to the LIBXML executable file is not specified in the **Executable path** text field, some errors may occur during validation against a W3C XML Schema, such as:

```
Unimplemented block at ... xmlschema.c
```

To avoid these errors, specify the full path to the LIBXML executable file.

- Saxon-EE Included in Oxygen XML Developer plugin. It is associated to XML Editor and XSD Editor. It is able to validate XML Schema schemas and XML documents against XML Schema schemas. The validation is done according to the W3C XML Schema 1.0 or 1.1. This can be *configured in Preferences*.
- MSXML 4.0 Included in Oxygen XML Developer plugin (Windows edition only). It is associated to XML Editor, XSD Editor and XSL Editor. It is able to validate the edited document against XML Schema, internal DTD (included in the XML document), external DTD or a custom schema type.

- MSXML.NET Included in Oxygen XML Developer plugin (Windows edition only). It is associated to XML Editor, XSD Editor and XSL Editor. It is able to validate the edited document against XML Schema, internal DTD (included in the XML document), external DTD or a custom schema type.
- XSV Not included in Oxygen XML Developer plugin. Windows and Linux distributions of XSV can be downloaded from http://www.cogsci.ed.ac.uk/~ht/xsv-status.html. The executable path is attraction folder in Oxygen XML Developer plugin for the [OXYGEN_DIR]/xsv installation folder. If it is installed in a different folder the predefined executable path must be corrected in Preferences. It is associated to XML Editor and XSD Editor. It is able to validate the edited document against XML Schema or a custom schema type.
- SQC (Schema Quality Checker from IBM) Not included in Oxygen XML Developer plugin. It can be downloaded *from here* (it comes as a .zip file, at the time of this writing SQC2.2.1.zip is about 3 megabytes). The executable path and working directory are already configured for the SQC installation directory [OXYGEN_DIR]/sqc. If it is installed in a different folder the predefined executable path and working directory must be *corrected in the Preferences page*. It is associated to XSD Editor.

Linked Output Messages of an External Engine

Validation engines display messages in an output view at the bottom of the Oxygen XML Developer plugin window. If such an output message (*warning*, *error*, *fatal error*, etc) spans between three to six lines of text and has the following format, then the message is linked to a location in the validated document. Clicking the message in the output view highlights the location of the message in an editor panel containing the file referenced in the message. This behavior is similar to the linked messages generated by the default built-in validator.

Linked messages have the following format:

- Type:[F|E|W] (the string Type: followed by a letter for the type of the message: fatal error, error, warning) this property is optional in a linked message
- SystemID: a system ID of a file (the string SystemID: followed by the system ID of the file that will be opened for highlighting when the message is clicked in the output message usually the validated file, the schema file or an included file)
- Line: a line number (the string Line: followed by the number of the line that will be highlighted)
- *Column*: a column number (the string *Column*: followed by the number of the column where the highlight will start on the highlighted line) this property is optional in a linked message
- *EndLine*: a line number (the string *EndLine*: followed by the number of the line where the highlight ends) this property is optional in a linked message
- *EndColumn*: a column number (the string *EndColumn*: followed by the number of the column where the highlight ends on the end line) this property is optional in a linked message

Note: The *Line/Column* pair works in conjunction with the *EndLine/EndColumn* pair. Thus, if both pairs are specified, then the highlight starts at *Line/Column* and ends at *EndLine/EndColumn*. If the *EndLine/EndColumn* pair is missing, the highlight starts from the beginning of the line identified by the *Line* parameter and ends at the column identified by the *Column* parameter.

- AdditionalInfoURL: the URL string pointing to a remote location where additional information about the error can be found this line is optional in a linked message.
- *Description*: message content (the string *Description*: followed by the content of the message that will be displayed in the output view).

Example of how a custom validation engine can report an error using the format specified above:

```
Type: E
SystemID: file:///c:/path/to/validatedFile.xml
Line: 10
Column: 20
EndLine: 10
EndColumn: 35
AdditionalInfoURL: http://www.host.com/path/to/errors.html#errorID
Description: custom validator message
```

A complex XML document is split in smaller interrelated modules. These modules do not make much sense individually and cannot be validated in isolation due to interdependencies with other modules. Oxygen XML Developer plugin validates the main module of the document when an imported module is checked for errors.

A typical example is the chunking DocBook XSL stylesheet which has chunk.xsl as the main module and param.xsl, chunk-common.xsl, and chunk-code.xsl as imported modules. param.xsl only defines XSLT parameters. The module chunk-common.xsl defines an XSLT template with the name chunk. Chunk-code.xsl calls this template. The parameters defined in param.xsl are used in the other modules without being redefined.

Validating chunk-code.xsl as an individual XSLT stylesheet, generates misleading errors in regards to parameters and templates that are used but undefined. These errors are only caused by ignoring the context in which this module is used in real XSLT transformations and in which it is validated. To validate such a module, define a validation scenario to set the main module of the stylesheet and the validation engine used to find the errors. Usually this engine applies the transformation during the validation process to detect the errors that the transformation generates.

You can validate a stylesheet with several engines to make sure that you can use it in different environments and have the same results. For example an XSLT stylesheet is applied with Saxon 6.5, Xalan, and MSXML 4.0 in different production systems.

Other examples of documents which can benefit of a validation scenario are:

- A complex XQuery with a main module which imports modules developed independently but validated in the context
 of the main module of the query. In an XQuery validation scenario the default validator of Oxygen XML Developer
 plugin (Saxon 9) or any connection to a database that supports validation (Berkeley DB XML Database, eXist XML
 Database, Documentum xDb (X-Hive/DB) 10 XML Database, MarkLogic version 5 or newer) can be set as a
 validation engine.
- An XML document in which the master file includes smaller fragment files using XML entity references.

Note: When you validate a document for which a master file is defined, Oxygen XML Developer plugin uses the scenarios defined in *the Master Files directory*.

To watch our video demonstration about how to use a validation scenario in Oxygen XML Developer plugin, go to http://oxygenxml.com/demo/Validation_Scenario.html.

How to Create a Validation Scenario

To create a validation scenario, follow these steps:

- 1. Select the Configure Validation Scenario(s) from the XML menu, or the toolbar, or from the Validate submenu when invoking the contextual menu on a file in the Navigator view.
 - The Configure Validation Scenario(s) dialog box is displayed. It contains the following types of scenarios:
 - **Predefined** scenarios are organized in categories depending on the type of file they apply to. You can identify **Predefined** scenarios by a yellow key icon that marks them as *read-only*. If the predefined scenario is the default scenario of the framework, its name is written in bold font. You can use the options in the **Settings** drop-down menu to filter which scenarios are shown.
 - User defined scenarios are organized under a single category, but you can use the options in the Settings drop-down menu to filter them.

Note: If the current file has no associated scenarios, the preview area displays a message to let you know that you can apply the default validation.

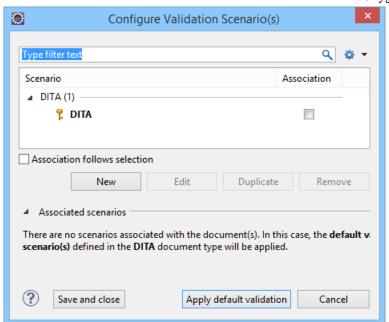

Figure 51: Configure Validation Scenario

- **2.** To edit an existing scenario, select the scenario and press the **Edit** button. If you try to edit one of the *read-only* predefined scenarios, Oxygen XML Developer plugin creates a customizable duplicate (you can also use the **Duplicate** button).
- 3. To add a new scenario, press the New button.
 The New scenarios dialog box is displayed. It lists all the validation units for the scenario.

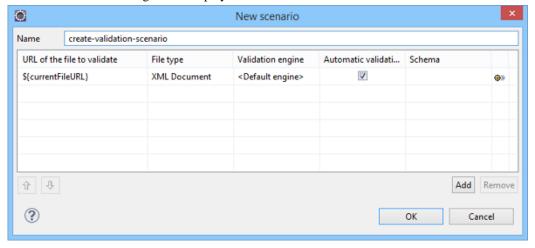

Figure 52: Add / Edit a Validation Unit

The **New scenario** dialog box includes the following information:

- Name The name of the current validation scenario.
- **URL** of the file to validate The URL of the main module that includes the current module. It is also the entry module of the validation process when the current one is validated.
- **File type** The type of the document that is validated in the current validation unit. Oxygen XML Developer plugin automatically selects the file type depending on the value of the **URL** of the file to validate field.
- Validation engine One of the engines available in Oxygen XML Developer plugin for validation of the type of document to which the current module belongs. **Default engine** means that the default engine is used to run

the validation and is set in the **Preferences** pages for the current document type (XML, XML Schema, XSLT, XQuery, etc.).

- **Automatic validation** If this option is checked, the validation operation defined by this row is also applied by the automatic validation feature. If the **Automatic validation** feature is disabled in Preferences, then this option is ignored, as the Preference setting has a higher priority.
- Schema This option becomes active when you set the File type to XML Document.
- Settings Opens the Specify Schema dialog box that allows you to set a schema for validating XML documents, or a list of extensions for validating XSL or XQuery documents. You can also set a default phase for validation with a Schematron schema.
- **4.** If you want to add a new validation unit, press the **Add** button.
- 5. To edit the URL of the main validation module, click its cell in the URL of the file to validate column.

Specify the URL of the main module by doing one of the following:

- Enter the URL in the text field or select it from the drop-down list.
- Use the Frowse drop-down button to browse for a local, remote, or archived file.
- Use the ... Insert Editor Variable button to insert an editor variable or a custom editor variable.

```
${start-dir} - Start directory of custom validator
${standard-params} - List of standard parameters
${cfn} - The current file name without extension
${currentFileURL} - The path of the currently edited file (URL)
${cfdu} - The path of current file directory (URL)
${frameworks} - Oxygen frameworks directory (URL)
${pdu} - Project directory (URL)
${oxygenHome} - Oxygen installation directory (URL)
${home} - The path to user home directory (URL)
${pn} - Project name
${env(VAR_NAME)} - Value of environment variable VAR_NAME
${system(var.name)} - Value of system variable var.name
```

Figure 53: Insert an Editor Variable

- Select the File type of the validated document.Note that this determines the list of possible validation engines.
- 7. Select the Validation engine by clicking its cell and selecting it from the drop-down list.
- 8. Select the Automatic validation option if you want the current unit to be used by the automatic validation feature.
- 9. Choose the schema to be used during validation (the schema detected after parsing the document or a custom one).
- 10. Press OK.

The newly created validation scenario is now included in the list of scenarios in the **Configure Validation Scenario(s)** dialog box. You can select the scenario in this dialog box to associate it with the current document and press the **Apply associated** button to run the validation scenario.

Sharing Validation Scenarios

The validation scenarios and their settings can be shared with other users by *exporting them to a specialized scenarios file* that can then be imported.

Validation Actions in the User Interface

To validate the currently edited document, use one of the following methods:

• Select the Validate (Alt + Shift + V, V) action from the XML menu, from the Validation toolbar drop-down menu, or from the Validate submenu when invoking the contextual menu in the Navigator view. An error list is presented in the message panel. Markup of current document is checked to conform with the specified DTD, XML Schema, or Relax NG schema rules. This action also re-parses the XML catalogs and resets the schema used for content completion.

- Select the Validate (cached) action from the XML menu or from the Validation toolbar drop-down menu. This action caches the schema, allowing it to be reused for the next validation. Markup of the current document is checked to conform with the specified DTD, XML Schema, or Relax NG schema rules.
 - Note: Automatic validation also caches the associated schema.
- Select the **Validate** with action from the **XML** menu, from the **Validation** toolbar drop-down menu, or from the **Validate** submenu when invoking the contextual menu in the **Navigator** view. You can use this action to validate the current document using a schema of your choice (XML Schema, DTD, Relax NG, NVDL, Schematron schema), other than the associated one. An error list is presented in the message panel. Markup of current document is checked to conform with the specified schema rules.
- Select Validate with Schema from the Validate submenu when invoking contextual menu in the Navigator view to choose a schema and validate all selected files with it.

To open the schema used for validating the current document, select the Den Associated Schema action from the XML menu.

To clear the error markers added to the **Problems** view in the last validation, select **Clear Validation Markers** from the **Validate** submenu when invoking the contextual menu in the **Navigator** view.

Tip: If a large number of validation errors are detected and the validation process takes too long, you can *limit* the maximum number of reported errors in the **Preferences** page.

Resolving References to Remote Schemas with an XML Catalog

When a reference to a remote schema must be used in the validated XML document for interoperability purposes, but a local copy of the schema should be actually used for validation for performance reasons, the reference can be resolved to the local copy of the schema with an *XML catalog*. For example, if the XML document contains a reference to a remote schema docbook.rng like this:

```
<?xml-model href="http://www.oasis-open.org/docbook/xml/5.0/rng/docbook.rng" type="application/xml"
schematypens="http://relaxng.org/ns/structure/1.0"?>
```

it can be resolved to a local copy with a catalog entry:

```
<uri name="http://www.oasis-open.org/docbook/xml/5.0/rng/docbook.rng"
    uri="rng/docbook.rng"/>
```

An XML catalog can be used also to map a W3C XML Schema specified with an URN in the xsi:schemaLocation attribute of an XML document to a local copy of the schema. For example, if the XML document specifies the schema with:

the URN can be resolved to a local schema file with a catalog entry like:

Document Navigation

This section explains various methods for navigating the edited XML document.

Folding of the XML Elements

An XML document is organized as a tree of elements. When working on a large document you can collapse some elements, leaving only the ones you need to edit in the focus. Expanding and collapsing works on individual elements. Expanding an element leaves the child elements unchanged.

Figure 54: Folding of the XML Elements

To toggle the folded state of an element, click the special mark displayed in the left part of the document editor, next to the start tag of that element.

The following other menu actions related to folding of XML elements are available from the contextual menu of the current editor:

Collapse Other Folds (Ctrl NumPad / (Meta NumPad / on OS X))

Folds all the elements except the current element.

Collapse Child Folds (<u>Ctrl + NumPad- (Meta + NumPad- on OS X</u>)

Folds the elements indented with one level inside the current element.

Expand Child Folds (Ctrl NumPad+ (Meta NumPad+ on OS X))

Unfolds all child elements of the currently selected element.

Expand All (Ctrl NumPad * (Meta NumPad * on OS X))

Unfolds all elements in the current document.

To watch our video demonstration about the folding support in Oxygen XML Developer plugin, go to http://oxygenxml.com/demo/FoldingSupport.html.

Navigation Using the Outline View

The **Outline** view displays a general tag overview of the currently edited XML Document. It also shows the correct hierarchical dependencies between elements. This makes it easier for you to be aware of the document structure and the way element tags are nested. It allows for fast navigation of the document by displaying the start of the content of the child elements in the node of the parent element, thus allowing you to quickly see the content of an element without expanding it in the **Outline** tree. It also allows you to insert or delete nodes using contextual menu actions.

By default it is displayed on screen, but if you closed it you can reopen it from Window > Show View > Outline.

The upper part of the **Outline** view contains a filter box that allows you to focus on the relevant components. Type a text fragment in the filter box and only the components that match it are presented. For advanced usage you can use wildcard characters (*, ?) and separate multiple patterns with commas.

It also includes a in the top-right corner that presents a variety of options to help you filter the view even further.

XML Document Overview

The **Outline** view displays a general tag overview of the current edited XML document. It also shows the correct hierarchical dependencies between the tag elements. This functionality makes it easier for you to be aware of the document structure and the way tags are nested.

The **Outline** view allows you to:

- Insert or delete nodes using contextual menu actions.
- Move elements by dragging them to a new position in the tree structure.
- Highlight elements in the **Author** editor area.

Note: The **Outline** view is synchronized with the **Author** editor area. When you make a selection in the **Author** editor area, the corresponding elements of the selection are highlighted in the **Outline** view and vice versa. This functionality is available both for single and multiple selection. To deselect one of the elements, use **Ctrl Single-Click (Command Single-Click on OS X)**.

Document errors (such as an element inserted in an invalid position, or a wrong attribute name, or a missing required attribute value) are highlighted in the **Outline** tree:

- A red exclamation mark decorates the element icon.
- A dotted red underline decorates the element name and value.
- A tooltip provides more information about the nature of the error, when you hover with the mouse pointer over the faulted element.

Modification Follow-up

When you edit a document, the **Outline** view dynamically follows the changes that you make, displaying the node that you modify in the middle of the view. This functionality gives you great insight on the location of your modifications in the document that you edit.

Drag and Drop Actions in Outline View

Entire XML elements can be moved or copied in the edited document using only the mouse in the **Outline** view with drag-and-drop operations. Several drag and drop actions are possible:

- If you drag an XML element in the **Outline** view and drop it on another one in the same panel then the dragged element will be moved after the drop target element.
- If you hold the mouse pointer over the drop target for a short time before the drop then the drop target element will be expanded first and the dragged element will be moved inside the drop target element after its opening tag.
- You can also drop an element before or after another element if you hold the mouse pointer towards the upper or lower part of the targeted element. A marker will indicate whether the drop will be performed before or after the target element.
- If you hold down the (Ctrl (Command on OS X)) key after dragging, there will be performed a copy operation instead of a move one.

The drag and drop action in the **Outline** view can be disabled and enabled from a Preferences page.

Document Tag Selection

The Outline view can also be used to search for a specific tag location and contents in the edited document. Intuitively, by selecting with the left mouse button the desired tag in the Outline view, the document is scrolled to the position of the selected tag. Moreover, the tag contents are selected in the document, making it easy to notice the part of the document contained by that specific tag and furthermore to easily copy and paste the tag's contents in other parts of the document or in other documents.

You can double click the tag in the **Outline** tree to move the focus in the editor.

You can also use the filter text field search to look for a particular tag name in the Outline tree.

Finding and Replacing Text in the Current File

This section walks you through the find and replace features available in Oxygen XML Developer plugin.

You can use a number of advanced views depending on what you need to find in the document you are editing or in your entire project. The *Find All Elements/Attributes dialog box* allows you to search through the structure of the current document for elements and attributes.

The Find All Elements Dialog Box

To open the **Find All Elements** dialog box, go to **Edit** > **Find All Elements**. It assists you in defining XML element / attribute search operations in the current document.

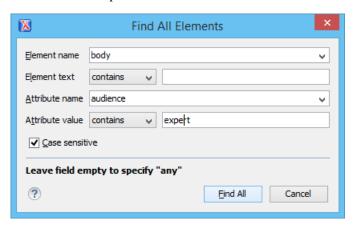

Figure 55: Find All Elements Dialog Box

The dialog box can perform the following actions:

- Find all the elements with a specified name
- Find all the elements that contain, or does not contain, a specified string in their text content
- Find all the elements that have a specified attribute
- Find all the elements that have an attribute with, or without, a specified value

You can combine all of these search criteria to filter your results.

The following fields are available in the dialog box:

• **Element name** - The qualified name of the target element to search for. You can use the drop-down menu to find an element or enter it manually. It is populated with valid element names collected from the associated schema. To specify *any* element name, leave the field empty.

Note: Use the qualified name of the element (<namespace prefix>:<element name>) when the document uses this element notation.

- Element text The target element text to search for. The drop-down menu beside this field allows you to specify whether you are looking for an exact or partial match of the element text. For any element text, select contains from the drop-down menu and leave the field empty. If you leave the field empty but select equals from the drop-down menu, only elements with no text will be found. Select not contains to find all elements that do not include the specified text.
- Attribute name The name of the attribute that must be present in the element. You can use the drop-down menu to select an attribute or enter it manually. It is populated with valid attribute names collected from the associated schema. For *any* or no attribute name, leave the field empty.
 - E,

Note: Use the qualified name of the attribute (<namespace prefix>:<attribute name>) when the document uses this attribute notation.

- Attribute value The drop-down menu beside this field allows you to specify that you are looking for an exact or partial match of the attribute value. For *any* or no attribute value, select **contains** from the drop-down menu and leave the field empty. If you leave the field empty but select **equals** from the drop-down menu, only elements that have at least an attribute with an empty value will be found. Select **not contains** to find all elements that have attributes without a specified value.
- Case sensitive When this option is checked, operations are case-sensitive

When you press **Find All**, Oxygen XML Developer plugin tries to find the items that match all the search parameters. The results of the operation are presented as a list in the message panel.

Regular Expressions Syntax

Oxygen XML Developer plugin uses the Java regular expression syntax. It is **similar** to that used in Perl 5, with several exceptions. Thus, Oxygen XML Developer plugin does not support the following constructs:

- The conditional constructs $(?\{X\})$ and (?(condition)X|Y).
- The embedded code constructs (?{code}) and (??{code}).
- The embedded comment syntax (?#comment).
- The preprocessing operations \1, \u, \L, and \U.

There are some other notable differences that may cause unexpected results, including the following:

- In Perl, \1 through \9 are always interpreted as back references; a backslash-escaped number greater than 9 is treated as a back reference if at least that many sub-expressions exist, otherwise it is interpreted, if possible, as an octal escape. In this class octal escapes must always begin with a zero. In Java, \1 through \9 are always interpreted as back references, and a larger number is accepted as a back reference if at least that many sub-expressions exist at that point in the regular expression, otherwise the parser will drop digits until the number is smaller or equal to the existing number of groups or it is one digit.
- Perl uses the g flag to request a match that resumes where the last match left off.
- In Perl, embedded flags at the top level of an expression affect the whole expression. In Java, embedded flags always take effect at the point at which they appear, whether they are at the top level or within a group; in the latter case, flags are restored at the end of the group just as in Perl.
- Perl is forgiving about malformed matching constructs, as in the expression *a, as well as dangling brackets, as in the expression abc], and treats them as literals. This class also accepts dangling brackets but is strict about dangling meta-characters like +, ? and *.

Editing Large XML Documents

Consider the case of documenting a large project. It is likely that there will be several people involved. The resulting document can be few megabytes in size. The question becomes how to deal with this amount of data in such a way that work parallelism will not be affected.

Fortunately, XML provides two solutions for this: DTD entities and XInclude. A master document can be created, with references to the other document parts, containing the document sections. The users can edit the documents individually, then apply an XSLT stylesheet over the master and obtain the output files in various formats (for example, PDF or HTML).

Including Document Parts with DTD Entities

There are two conditions for including a part using DTD entities:

- The master document should declare the DTD to be used, while the external entities should declare the XML sections to be referenced.
- The document containing the section must not define again the DTD.

```
A master document looks like this:
```

The referenced document looks like this:

```
<section> ... here comes the section content ...
```

Note:

The indicated DTD and the element names (*section*, *chapter*) are used here only for illustrating the inclusion mechanism. You can use any DTD and element names you need.

At a certain point in the master document there can be inserted the section testing.xml entity:

```
... &testing; ...
```

When splitting a large document and including the separate parts in the master file using external entities, only the master file will contain the Document Type Definition (the DTD) or other type of schema. The included sections can not define the schema again because the main document will not be valid. If you want to validate the parts separately you have to *use XInclude* for assembling the parts together with the master file.

Including Document Parts with XInclude

XInclude is a standard for assembling XML instances into another XML document through inclusion. It enables larger documents to be dynamically created from smaller XML documents without having to physically duplicate the content of the smaller files in the main file. XInclude is targeted as the replacement for External Entities. The advantage of using XInclude is that, unlike the entities method, each of the assembled documents is permitted to contain a Document Type Declaration (DOCTYPE). This means that each file is a valid XML instance and can be independently validated. It also means that the main document to which smaller instances are included can be validated without having to remove or comment out the DOCTYPE. as is the case with External Entities. This makes XInclude a more convenient and effective method for managing XML instances that need to be stand-alone documents and part of a much larger project.

The main application for XInclude is in the document-oriented content frameworks such as manuals and Web pages. Employing XInclude enables authors and content managers to manage content in a modular fashion that is akin to Object Oriented methods used in languages such as Java, C++ or C#.

The advantages of modular documentation include: reusable content units, smaller file units that are easier to be edited, better version control and distributed authoring.

Include a chapter in an article using XInclude

Create a chapter file and an article file in the samples folder of the Oxygen XML Developer plugin install folder.

Chapter file (introduction.xml) looks like this:

Main article file looks like this:

```
</mi:include>
</article>
```

In this example the following is of note:

- The DOCTYPE declaration defines an entity that references a file containing the information to add the *xi* namespace to certain elements defined by the DocBook DTD.
- The href attribute of the xi:include element specifies that the introduction.xml file will replace the xi:include element when the document is parsed.
- If the introduction.xml file cannot be found, the parser will use the value of the *xi:fallback* element a FIXME message.

If you want to include only a fragment of a file in the master file, the fragment must be contained in a tag having an *xml:id* attribute and you must use an XPointer expression pointing to the xml:id value. For example if the master file is:

and the a.xml file is:

after resolving the XPointer reference the document is:

The XInclude support in Oxygen XML Developer plugin is enabled by default. To *configure it*, *open the Preferences dialog box* and go to **XML** > **XML Parser** > **Enable XInclude processing**. When enabled, Oxygen XML Developer plugin will be able to validate and transform documents comprised of parts added using XInclude.

Working with XML Catalogs

An XML Catalog maps a system ID or an URI reference pointing to a resource (stored either remotely or locally) to a local copy of the same resource. If XML processing relies on external resources (like referenced schemas and stylesheets, for example), the use of an XML Catalog becomes a necessity when Internet access is not available or the Internet connection is slow.

Oxygen XML Developer plugin supports any XML Catalog file that conforms to one of:

- 1. OASIS XML Catalogs Committee Specification v1.1
- 2. OASIS Technical Resolution 9401:1997 including the plain-text flavor described in that resolution

The version 1.1 of the OASIS XML Catalog specification introduces the possibility to map a system ID, a public ID or a URI to a local copy using only a suffix of the ID or URI used in the actual document. This is done using the catalog elements <code>systemSuffix</code> and <code>uriSuffix</code>.

Depending on the resource type, Oxygen XML Developer plugin uses different catalog mappings.

Document	Referenced Resource	Mappings
XML	DTD	system or public
		The <i>Prefer</i> option controls which one of the mappings should be used.
	XML Schema	The following strategy is used (if one step fails to provide a resource, the next is applied):
	Relax NG Schematron NVDL	 resolve the schema using <i>URI</i> catalog mappings. resolve the schema using <i>system</i> catalog mappings.
		This happens only if the <i>Resolve schema locations also through system mappings</i> option is enabled (it is by default).
		3. resolve the root <i>namespace</i> using <i>URI</i> catalog mappings.
XSL	XSL/ANY	URI
CSS	CSS	URI
XML Schema Relax NG	XML Schema Relax NG	The following strategy is used (if one step fails to provide a resource, the next is applied):
		 resolve schema reference using <i>URI</i> catalog mappings. resolve schema reference using <i>system</i> catalog mappings.
		This happens only if the <i>Resolve schema locations also through system mappings</i> option is enabled (it is by default).
		3. resolve schema <i>namespace</i> using <i>uri</i> catalog mappings.
		This happens only if the <i>Process namespaces through URI mappings for XML Schema</i> option is enabled (it is not by default).

An XML Catalog file can be created quickly in Oxygen XML Developer plugin starting from the two XML Catalog document templates called *OASIS XML Catalog 1.0* and *OASIS XML Catalog 1.1* and available when *creating new document templates*.

```
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE catalog
      PUBLIC "-//OASIS//DTD XML Catalogs V1.1//EN"
      "http://www.oasis-open.org/committees/entity/release/1.1/catalog.dtd">
<catalog xmlns="urn:oasis:names:tc:entity:xmlns:xml:catalog">
    <!-- Use "system" and "public" mappings when resolving DTDs -->
          systemId="http://www.docbook.org/xml/4.4/docbookx.dtd"
   uri="frameworks/docbook/4.4/dtd/docbookx.dtd"/>
<!-- The "systemSuffix" matches any system ID ending in a specified string -->
    <systemSuffix
          systemIdSuffix="docbookx.dtd"
          uri="frameworks/docbook/dtd/docbookx.dtd"/>
    <!-- Use "uri" for resolving XML Schema and XSLT stylesheets -->
    <uri
          name="http://www.oasis-open.org/docbook/xml/5.0/rng/docbook.rng"
          uri="frameworks/docbook/5.0/rng/docbookxi.rng"/>
    <!-- The "uriSuffix" matches any URI ending in a specified string -->
    <uriSuffix
          uriSuffix="docbook.xsl"
          uri="frameworks/docbook/xsl/fo/docbook.xsl"/>
</catalog>
```

Oxygen XML Developer plugin comes with a built-in catalog set as default, but you can also create your own one. Oxygen XML Developer plugin looks for a catalog in the following order:

- User-defined catalogs set globally in the XML Catalog preferences page.
- User-defined catalogs set at document type level, in the Catalog tab from the Document Type configuration dialog box.
- · Built-in catalogs.

Resolve Schemas Through XML Catalogs

Oxygen XML Developer plugin resolves the location of a schema in the following order:

- First, it attempts to resolve the schema location as a URI (uri, uriSuffix, rerwriteURI mappings from the XML catalog). If this succeeds, the process end here.
- If the *Resolve schema locations also through system mappings* option is selected, it attempts to resolve the schema location as a systemID (*system*, systemSuffix, rewriteSuffix, rerwriteSystem from the XML catalog). If this succeeds, the process ends here.
- If the *Process namespace through URI mappings for XML Schema* option is selected, it attempts to resolve the
 location by processing the schema namespace as a URI (uri, uriSuffix, rewriteURI from the XML catalog).
 The namespace is taken into account only when the schema specified in the *schemaLocation* attribute was not resolved
 successfully. If this succeeds, the process ends here.
- If none of these succeeds, the actual schema location is used.

XML Resource Hierarchy/Dependencies View

The **Resource Hierarchy/Dependencies** view allows you to easily see the hierarchy / dependencies for an XML document. The tree structure presented in this view is built based on the *XIinclude* and *External Entity* mechanisms. To define the scope for calculating the dependencies of a resource, click *Configure dependencies search scope* on the **Resource Hierarchy/Dependencies** toolbar.

To open this view, go to Window > Show View > Other > Oxygen XML Developer plugin > Resource Hierarchy/Dependencies. As an alternative, right click the current document and either select Resource Hierarchy or Resource Dependencies.

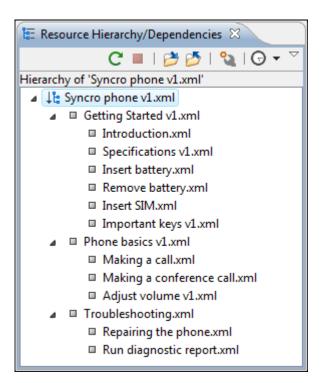

Figure 56: Resource Hierarchy/Dependencies View - Hierarchy for Syncro phone v1.xml

The build process for the dependencies view is started with the **Resource Dependencies** action available on the contextual menu.

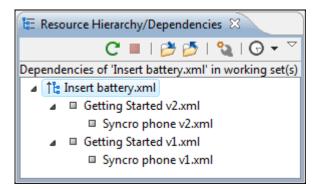

Figure 57: Resource Hierarchy/Dependencies View - Dependencies for Insert battery.xml

The following actions are available in the **Resource Hierarchy/Dependencies** view:

C Refresh

Refreshes the Hierarchy/Dependencies structure.

Stor

Stops the hierarchy/dependencies computing.

Show Hierarchy

Allows you to choose a resource to compute the hierarchy structure.

Show Dependencies

Allows you to choose a resource to compute the dependencies structure.

Configure

Allows you to configure a scope to compute the dependencies structure. There is also an option for automatically using the defined scope for future operations.

Q. History

Provides access to the list of previously computed dependencies. Use the * Clear history button to remove all items from this list.

The contextual menu contains the following actions:

Open

Opens the resource. You can also double-click a resource in the Hierarchy/Dependencies structure to open it.

Copy location

Copies the location of the resource.

Move resource

Moves the selected resource.

Rename resource

Renames the selected resource.

Show Resource Hierarchy

Shows the hierarchy for the selected resource.

Show Resource Dependencies

Shows the dependencies for the selected resource.

👺 Add to Master Files

Adds the currently selected resource in the Master Files directory.

Expand All

Expands all the children of the selected resource from the Hierarchy/Dependencies structure.

Collapse All

Collapses all children of the selected resource from the Hierarchy/Dependencies structure.

Tip: When a recursive reference is encountered in the Hierarchy view, the reference is marked with a special icon \$.

Note: The **Move resource** or **Rename resource** actions give you the option to *update the references to the* resource. Only the references made through the XInclude and External Entity mechanisms are handled.

Moving/Renaming XML Resources

When you select the **Rename** action in the contextual menu of the **Resource/Hierarchy Dependencies** view, the **Rename resource** dialog box is displayed. The following fields are available:

- New name Presents the current name of the edited resource and allows you to modify it.
- Update references Enable this option to update the references to the resource you are renaming.

When you select the **Move** action from the contextual menu of the **Resource/Hierarchy Dependencies** view, the **Move resource** dialog box is displayed. The following fields are available:

- Destination Presents the path to the current location of the resource you want to move and gives you the option to introduce a new location.
- New name Presents the current name of the moved resource and gives you the option to change it.
- **Update references of the moved resource(s)** Enable this option to update the references to the resource you are moving, in accordance with the new location and name.

If the Update references of the moved resource(s) option is enabled, a Preview option (which opens the Preview dialog box) is available for both actions. The **Preview** dialog box presents a list with the resources that are updated. The **Generate/Convert Schema** dialog box allows you to convert a DTD or Relax NG (full or compact syntax) schema or a set of XML files to an equivalent XML Schema, DTD or Relax NG (full or compact syntax) schema. Where perfect equivalence is not possible due to limitations of the target language, Oxygen XML Developer plugin generates an approximation of the source schema. Oxygen XML Developer plugin uses *Trang multiple format converter* to perform the actual schema conversions.

To open the Generate/Convert Schema dialog box, select the Generate/Convert Schema($Ctrl + Shift + \ (Meta + Shift + \)$ action from the XML Tools menu.

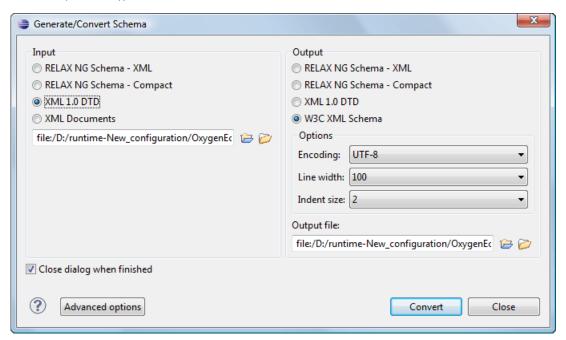

Figure 58: Convert a Schema to Other Schema Language

The language of the target schema is specified with one of the four options in the **Output** panel. Here you can also choose the encoding, the maximum line width and the number of spaces for one level of indentation.

The conversion can be further fine-tuned by specifying more advanced options available from the **Advanced options** button. For example if the input is a DTD and the output is an XML Schema the following options are available:

Input panel:

- xmlns Specifies the default namespace, that is the namespace used for unqualified element names.
- xmlns Each row specifies the prefix used for a namespace in the input schema.
- **colon-replacement** Replaces colons in element names with the specified chars when constructing the names of definitions used to represent the element declarations and attribute list declarations in the DTD.
- **element-define** Specifies how to construct the name of the definition representing an element declaration from the name of the element. The specified value must contain exactly one percent character. This percent character is replaced by the name of element (after colon replacement) and the result is used as the name of the definition.
- **inline-attlist** Instructs the application not to generate definitions for attribute list declarations, but instead move attributes declared in attribute list declarations into the definitions generated for element declarations. This is the default behavior when the output language is XSD.
- attlist-define Specifies how to construct the name of the definition representing an attribute list declaration from the name of the element. The specified value must contain exactly one percent character. This percent character is replaced by the name of element (after colon replacement) and the result is used as the name of the definition.
- **any-name** Specifies the name of the definition generated for the content of elements declared in the DTD as having a content model of ANY.

- **strict-any** Preserves the exact semantics of *ANY* content models by using an explicit choice of references to all declared elements. By default, the conversion engine uses a wildcard that allows any element
- **generate-start** Specifies whether the conversion engine should generate a start element. DTD's do not indicate what elements are allowed as document elements. The conversion engine assumes that all elements that are defined but never referenced are allowed as document elements.
- annotation-prefix Default values are represented using an annotation attribute prefix:defaultValue where prefix is the specified value and is bound to http://relaxng.org/ns/compatibility/annotations/1.0 as defined by the RELAX NG DTD Compatibility Committee Specification. By default, the conversion engine will use a for prefix unless that conflicts with a prefix used in the DTD.

Output panel:

- **disable-abstract-elements** Disables the use of abstract elements and substitution groups in the generated XML Schema. This can also be controlled using an annotation attribute.
- any-process-contents One of the values: strict, lax, skip. Specifies the value for the processContents attribute of any elements. The default is skip (corresponding to RELAX NG semantics) unless the input format is DTD, in which case the default is strict (corresponding to DTD semantics).
- **any-attribute-process-contents** Specifies the value for the processContents attribute of anyAttribute elements. The default is skip (corresponding to RELAX NG semantics).

Editing Modular XML Files in the Master Files Context

Smaller interrelated modules that define a complex XML modular structure cannot be correctly edited or validated individually, due to their interdependency with other modules. Oxygen XML Developer plugin provides the support for defining the main module (or modules), allowing you to edit any file from the hierarchy in the context of the master XML files.

You cat set a main XML document either using the *master files support from the Navigator view*, or using a validation scenario.

To set a main file using a validation scenario, add validation units that point to the main modules. Oxygen XML Developer plugin warns you if the current module is not part of the dependencies graph computed for the main XML document. In this case, it considers the current module as the main XML document.

The advantages of editing in the context of a master file include:

- Correct validation of a module in the context of a larger XML structure.
- Content Completion Assistant displays all collected entities and IDs starting from the master files.
- Oxygen XML Developer plugin uses the schema defined in the master file when you edit a module which is included in the hierarchy through the *External Entity* mechanism.
- The master files defined for the current module determines the *scope of the search and refactoring actions* for ID/IDREFS values and for updating references when renaming/moving a resource. Oxygen XML Developer plugin performs the search and refactoring actions in the context that the master files determine, improving the speed of execution.

To watch our video demonstration about editing modular XML files in the master files context, go to http://oxygenxml.com/demo/Working_With_XML_Modules.html.

Search and Refactor Actions for IDs and IDREFS

Oxygen XML Developer plugin allows you to search for ID declarations and references (IDREFS) and to *define the scope of the search and refactor operations*. These operations are available for XML documents that have an associated DTD, XML Schema, or Relax NG schema. These operations are available through the search and refactor actions in the contextual menu. In **Text** mode, these actions are also available in the *Quick Assist* menu.

The search and refactor actions from the contextual menu are grouped in the **Manage IDs** section:

Renames the ID and all its occurrences. Selecting this action opens the **Rename XML ID** dialog box. This dialog box lets you insert the new ID value and *choose the scope of the rename operation*. For a preview of the changes you are about to make, click **Preview**. This opens the **Preview** dialog box, which presents a list with the files that contain changes and a preview zone of these changes.

Rename in File

Renames the ID you are editing and all its occurrences from the current file.

Note: Available in the **Text** mode only.

Search References

Searches for the references of the ID. By default, the scope of this action is the current project. If you configure a scope using the Select the scope for the Search and Refactor operations dialog box, this scope will be used instead.

Search References in

Searches for the references of the ID. Selecting this action opens the Select the scope for the Search and Refactor operations.

Search Declarations

Searches for the declaration of the ID reference. By default, the scope of this action is the current project. If you configure a scope using the Select the scope for the Search and Refactor operations dialog box, this scope will be used instead.

Note: Available in the **Text** mode only.

Search Declarations in

Searches for the declaration of the ID reference. Selecting this action opens the Select the scope for the Search and Refactor operations.

Note: Available in the **Text** mode only.

Search Occurrences in file

Searches for the declaration and references of the ID in the current document.

Tip: A quick way to go to the declaration of an ID in Text mode is to move the cursor over an ID reference and use the Ctrl Single-Click (Command Single-Click on OS X) navigation.

Selecting an ID for which you use search or refactor operations differs between the Text and Author modes. In the **Text** mode, you position the cursor inside the declaration or reference of an ID. In the **Author** mode, Oxygen XML Developer plugin collects all the IDs by analyzing each element from the path to the root. If more IDs are available, you are prompted to choose one of them.

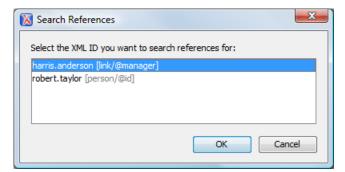

Figure 59: Selecting an ID in the Author Mode

Search and Refactor Operations Scope

The scope is a collection of documents that define the context of a search and refactor operation. To control it you can use the **Change scope** operation, available in the Quick Fix action set or on the **Resource Hierarchy/Dependency** View toolbar. You can restrict the scope to the current project or to one or multiple working sets. The Use only Master Files, if enabled check-box allows you to restrict the scope of the search and refactor operations to the resources from the **Master Files** directory. Click **read more** for details about the *Master Files support*.

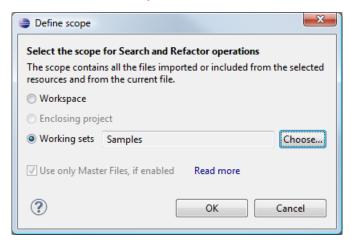

Figure 60: Change Scope Dialog Box

The scope you define is applied to all future search and refactor operations until you modify it. Contextual menu actions allow you to add or delete files, folders, and other resources to the working set structure.

Viewing Status Information

Status information generated by the Schema Detection, Validation, Automatic validation, and Transformation threads are fed into the **Console** view allowing you to monitor how the operation is being executed.

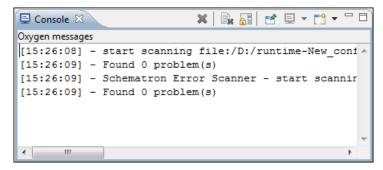

Figure 61: The Console view messages

Messages contain a timestamp, the name of the thread that generated it and the actual status information. The number of displayed messages in the **Console** view can be controlled from the *Options panel*.

In order to make the view visible go to menu **Window** > **Show View** > **Console**.

Editor Highlights

An editor highlight is a text fragment emphasized by a colored background.

Highlights are generated when the following actions generate results:

- Find/Replace
- Find All Elements
- XPath in Files

- Search References
- · Search Declarations

By default, Oxygen XML Developer plugin uses a different color for each type of highlight (*XPath in Files, Find/Replace, Search References, Search Declarations*, etc.) You can customize these colors and the maximum number of highlights displayed in a document on the *Editor preferences page*. The default maximum number of highlights is 10000.

You are able to navigate the highlights in the current document by using the following methods:

- Clicking the markers from the range ruler, located at the right side of the document.
- Clicking the Next and Previous buttons from the bottom of the range ruler.
 - Note: When there are multiple types of highlights in the document, the Next and Previous buttons navigate through highlights of the same type.
- Clicking the messages displayed in the *Results view* at the bottom of the editor.

To remove the highlights, you can do the following:

- Click the *** Remove all** button from bottom of the range ruler.
- Close the results tab at the bottom of the editor that contains the output of the action that generated the highlights.
- Click the Remove all button from the results panel at the bottom of the editor.

XML Quick Fixes

The Oxygen XML Developer plugin Quick Fix support helps you resolve errors that appear in an XML document by offering quick fixes to problems such as missing required attributes or invalid elements. Quick fixes are available in **Text** mode

To activate this feature, hover over or place the cursor in the highlighted area of text where a validation error or warning occurs. If a Quick Fix is available for that particular error or warning, you can access the Quick Fix proposals with any of the following methods:

• When hovering over the error or warning, the proposals are presented in a tooltip popup window and the available quick fixes include a link that can be used to perform the fix.

Figure 62: Quick Fix Presented in a Tooltip in Text Mode

• If you place the cursor in the highlighted area where a validation error or warning occurs, a quick fix icon (is displayed in the stripe on the left side of the editor. If you click this icon, Oxygen XML Developer plugin displays the list of available fixes.

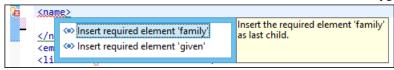

Figure 63: Quick Fix Menu Invoked by Clicking on the 12 Icon

With the cursor placed in the highlighted area of the error or warning, you can also invoke the quick fix menu by pressing Ctrl 1 (Meta 1 on OS X) on your keyboard.

Whenever you make a modification in the XML document or you apply a fix, the list of quick fixes is recomputed to ensure that you always have valid proposals.

Note: A quick fix that adds an element inserts it along with required and optional elements, and required and fixed attributes, depending on how the Content Completion Assistant options are configured.

Quick Fixes for XSD and Relax NG Errors

Oxygen XML Developer plugin offers quick fixes for common errors that appear in XML documents that are validated against XSD or Relax NG schemas.

Note: For XML documents validated against XSD schemas, the quick fixes are only available if you use the default Xerces validation engine.

Quick fixes are available in Text mode .

Oxygen XML Developer plugin provides quick fixes for numerous types of problems, including the following:

Problem type	Available quick fixes
A specific element is required in the current context	Insert the required element
An element is invalid in the current context	Remove the invalid element
The content of the element should be empty	Remove the element content
An element is not allowed to have child elements	Remove all child elements
Text is not allowed in the current element	Remove the text content
A required attribute is missing	Insert the required attribute
An attribute is not allowed to be set for the current element	Remove the attribute
The attribute value is invalid	Propose the correct attribute values
ID value is already defined	Generate a unique ID value
References to an invalid ID	Change the reference to an already defined ID

Schematron Quick Fixes (SQF)

Oxygen XML Developer plugin provides support for Schematron Quick Fixes (SQF). They help you resolve errors that appear in XML documents that are validated against Schematron schemas by offering you solution proposals. The Schematron Quick Fixes are an extension of the Schematron language and they allow you to define fixes for Schematron error messages. Specifically, they are associated with assert or report messages.

A typical use case is using Schematron Quick Fixes to assist technical writers with common editing tasks. For example, you can use Schematron rules to automatically report certain validation warnings (or errors) when performing regular editing tasks, such as inserting specific elements or changing IDs to match specific naming conventions. For more details and examples, please see the following blog:

http://blog.oxygenxml.com/2015/05/schematron-checks-to-help-technical.html.

Displaying the Schematron Quick Fix Proposals

The defined Schematron Quick Fixes are displayed on validation errors in **Text** mode.

Refactoring XML Documents

In the life cycle of XML documents there are instances when the XML structure needs to be changed to accommodate various needs. For example, when an associated schema is updated, an attribute may have been removed, or a new element added to the structure.

These types of situations cannot be resolved with a traditional *Find/Replace* tool, even if the tool accepts regular expressions. The problem becomes even more complicated if an XML document is computed or referenced from multiple modules, since multiple resources need to be changed.

To assist you with these types of refactoring tasks, Oxygen XML Developer plugin includes a specialized **XML Refactoring** tool that helps you manage the structure of your XML documents.

XML Refactoring Tool

The **XML Refactoring** tool is presented in the form of an easy to use wizard that is designed to reduce the time and effort required to perform various structure management tasks. For example, you can insert, delete, or rename an attribute in all instances of a particular element that is found in all documents within your project.

To access the tool, select the **XML Refactoring** action from one of the following locations:

- The XML Tools menu.
- The Refactoring submenu from the contextual menu in the Navigator view.

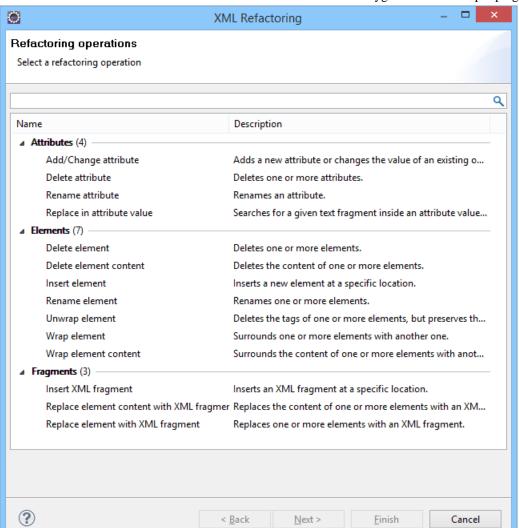

Note: The predefined refactoring operations are also available from the **Refactoring** submenu in the contextual menu of **Text** mode. This is useful because by selecting the operations from the contextual menu, Oxygen XML Developer plugin considers the editing context to skip directly to the wizard page of the appropriate operation and to help you by preconfiguring some of the parameter values.

The tool includes the following wizard pages:

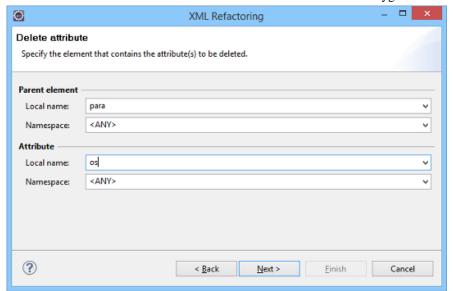

Refactoring operations

The first wizard page displays, and allows you to select, the available operations, which are grouped by category. To search for an operation, you can use the filter text box at the top of the page.

Configure Operation Parameters

The next wizard page allows you to specify the parameters for the refactoring operation. The parameters are specific to the type of refactoring operation that is being performed. For example, to delete an attribute you need to specify the parent element and the qualified name of the attribute to be removed.

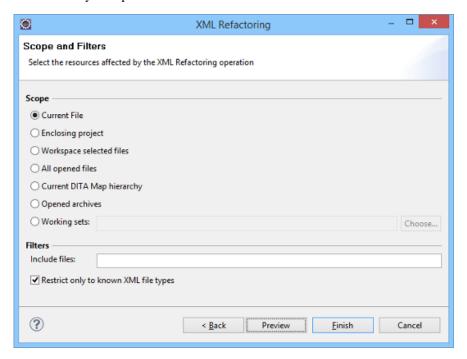

Scope and Filters

The last wizard page allows you to select the set of files that represent the input of the operation. You can select from predefined resource sets (such as the current file, your whole project, the current DITA map hierarchy, etc.) or you can define your own set of resources by creating a working set.

The **Filters** section includes the following options:

- Include files Allows you to filter the selected resources by using a file pattern. For example, to restrict the operation to only analyze build files you could use build*.xml for the file pattern.
- **Restrict only to known XML file types** When enabled, only resources with a known XML file type will be affected by the operation.

If an operation takes longer than expected you can use the **Stop** button in the progress bar to cancel the operation.

Note: It is recommended that you use the **Preview** button to review all the changes that will be made by the refactoring operation before applying the changes.

lacksquare

Warning: After clicking the **Finish** button, the operation will be processed and Oxygen XML Developer plugin provides no automatic means for reverting the operations. Any **Undo** action will only revert changes on the current document.

Predefined Refactoring Operations

The XML Refactoring tool includes a variety of predefined operations that can be used for common refactoring tasks. They are grouped by category in the **Refactoring operations** wizard page. You can also access the operations from the **Refactoring** submenu in the contextual menu of **Text** mode. The operations are also grouped by category in this submenu (**Attributes**, **Elements**, and **Fragments**). When selecting the operations from the contextual menu, Oxygen XML Developer plugin considers the editing context to get the names and namespaces of the current element or attribute, and uses this information to preconfigure some of the parameter values for the selected refactoring operation.

The following predefined operations are available:

Refactoring Operations for Attributes

Add/Change attribute

Use this operation to change the value of an attribute or insert a new one. To perform this operation, specify the following parameters:

- The parent **Element** of the attribute to be changed, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.
- The **Local name**, **Namespace**, and **Value** of the affected attribute.
- One of the following choices for the **Operation mode** in the *Options* section:
 - Add the attribute in the parent elements where it is missing
 - Change the value in the parent elements where the attribute already exists
 - Both

Delete attribute

Use this operation to remove one or more attributes. To perform this operation, specify the following parameters:

- The parent **Element** of the attribute to be deleted, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.
- The name of the **Attribute** to be deleted.

Rename attribute

Use this operation to rename an attribute. Specify the following parameters in the **Rename attribute** dialog box:

- The parent **Element** of the attribute to be renamed, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.
- The name of the **Attribute** to be renamed.
- New local name of the attribute.
- Tip: Use the link provided in the lower part of the wizard to open the XML / XSLT-FO-XQuery / XPath preferences page where you can configure XPath options and declare namespace prefixes.

Replace in attribute value

Use this operation to search for a text fragment inside an attribute value and change the fragment to a new value. To perform this operation, specify the following parameters:

- The parent **Element** of the attribute to be modified, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.
- The name of the **Attribute** to be modified.
- The text fragments to **Find**. You can use Perl-like regular expressions when specifying the text to find.
- The text fragment to **Replace with**. This parameter can bind regular expression capturing groups (\$1, \$2, etc.) from the find pattern.
- Tip: Use the link provided in the lower part of the wizard to open the XML / XSLT-FO-XQuery / XPath preferences page where you can configure XPath options and declare namespace prefixes.

Refactoring Operations for *Elements*

Delete element

Use this operation to delete elements. To perform this operation, specify the following parameter:

- The target **Element** to be deleted, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.
- Tip: Use the link provided in the lower part of the wizard to open the XML / XSLT-FO-XQuery / XPath preferences page where you can configure XPath options and declare namespace prefixes.

Delete element content

Use this operation to delete the content of elements. To perform this operation, specify the following parameter:

- The target **Element** in which its content is to be deleted, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.
- Tip: Use the link provided in the lower part of the wizard to open the XML / XSLT-FO-XQuery / XPath preferences page where you can configure XPath options and declare namespace prefixes.

Insert element

Use this operation to insert new elements. To perform this operation, specify the following parameters:

- The **Local name** of the element to be inserted.
- The **Namespace** of the element to be inserted.
- The **XPath** location of an existing element where the new element will be inserted, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.
- The **Position**, in relation to the specified existing element, where the new element will be inserted. The possible selections in the drop-down menu are: **After**, **Before**, **First child**, or **Last child**.
- Tip: Use the link provided in the lower part of the wizard to open the XML / XSLT-FO-XQuery / XPath preferences page where you can configure XPath options and declare namespace prefixes.

Rename element

Use this operation to rename elements. To perform this operation, specify the following parameters:

- The **Target elements** (**XPath**) to be renamed, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.
- The New local name of the element.
- Tip: Use the link provided in the lower part of the wizard to open the XML / XSLT-FO-XQuery / XPath preferences page where you can configure XPath options and declare namespace prefixes.

Unwrap element

Use this operation to remove the surrounding tags of elements, while keeping the content unchanged. To perform this operation, specify the following parameters:

• The **Target elements** (**XPath**) for which its surrounding tags will be removed, in the form of a local name from any namespace, a local name with a namespace prefix, or other **XPath** expressions.

i

Tip: Use the link provided in the lower part of the wizard to open the **XML / XSLT-FO-XQuery / XPath** preferences page where you can configure XPath options and declare namespace prefixes.

Wrap element

Use this operation to surround elements with element tags. To perform this operation, specify the following parameters:

- The **Target elements** (**XPath**) to be surrounded with tags, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.
- The **Local name** of the *Wrapper element*.
- The **Namespace** of the *Wrapper element*.

Wrap element content

Use this operation to surround the content of elements with element tags. To perform this operation, specify the following parameters:

- The **Target elements (XPath)** to surround its content with tags, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.
- The Local name of the Wrapper element in which its content will be wrapped.
- The **Namespace** of the *Wrapper element* in which its content will be wrapped.

Refactoring Operations for Fragments

Insert XML fragment

Use this operation to insert an XML fragment. To perform this operation, specify the following parameters:

- The **XML Fragment** to be inserted.
- The **XPath** location of an existing element where the fragment will be inserted, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.
- The **Position**, in relation to the specified existing element, where the fragment will be inserted. The possible selections in the drop-down menu are: **After**, **Before**, **First child**, or **Last child**.
- Tip: Use the link provided in the lower part of the wizard to open the XML / XSLT-FO-XQuery / XPath preferences page where you can configure XPath options and declare namespace prefixes.

Replace element content with XML fragment

Use this operation to replace the content of elements with an XML fragment. To perform this operation, specify the following parameters:

- The **Target elements** (**XPath**) for which its content will be replaced, in the form of a local name from any namespace, a local name with a namespace prefix, or other **XPath** expressions.
- The **XML Fragment** with which to replace the content of the target element.
- Tip: Use the link provided in the lower part of the wizard to open the XML / XSLT-FO-XQuery / XPath preferences page where you can configure XPath options and declare namespace prefixes.

Replace element with XML fragment

Use this operation to replace elements with an XML fragment. To perform this operation, specify the following parameters:

• The **Target elements** (**XPath**) to be replaced, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.

- The **XML Fragment** with which to replace the target element.
- Tip: Use the link provided in the lower part of the wizard to open the XML / XSLT-FO-XQuery / XPath preferences page where you can configure XPath options and declare namespace prefixes.

Additional Notes

Note: Some operations have parameters that accept XPath expressions to match elements or attributes. In these XPath expressions you can only use the prefixes declared in the *Options > Preferences > XML > XSLT-FO-XQUERY > XPath* page. This preferences page can be easily opened by clicking the link in the note (Each prefix used in an XPath expression must be declared in the Default prefix-namespace mappings section) at the bottom of the Configure Operation Parameters wizard page.

Custom Refactoring Operations

If none of the predefined operations will help you accomplish a particular refactoring task, you can create a custom operation that is specific to your needs. For example, if you want to convert an attribute to an element and insert the element as the first child of the parent element, a custom refactoring operation needs to be created.

Note: The custom refactoring operations are only available in the Enterprise edition.

An XML Refactoring operation is defined as a pair of resources:

- An XQuery Update script or XSLT stylesheet that Oxygen XML Developer plugin will run in order to refactor the XML files.
- An XML Operation Descriptor file that contains information about the operation, such as the name, description, and parameters.

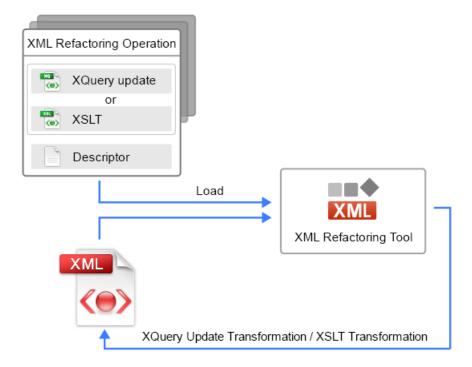

Figure 65: Diagram of an XML Refactoring Operation

All the defined custom operations are loaded by the XML Refactoring tool and presented in *the Refactoring operations* wizard page, along with the predefined built-in operations.

After the user chooses an operation and specifies its parameters, Oxygen XML Developer plugin processes an XQuery Update or XSLT transformation over the input file. This transformation is executed in a *safe mode*, which implies the following:

- When loading the document:
 - The XInclude mechanism is disabled. This means that the resources included by using XInclude will not be visible in the transformation.
 - The DTD entities will be processed without being expanded.
 - The associated DTD will be not loaded, so the default attributes declared in the DTD will not be visible in the transformation.
- When saving the updated XML document:
 - The DOCTYPE will be preserved.
 - The DTD entities will be preserved as they are in the original document when the document is saved.
 - The attribute values will be kept in their original form without being normalized.
 - The spaces between attributes are preserved. Basically, the spaces are lost by a regular XML serialization since they are not considered important.

The result of this transformation overrides the initial input file.

Note: To achieve some of the previous goals, the XML Refactoring mechanism adds several attributes that are interpreted internally. The attributes belong to the

http://oxygenxml.com/app/xml_refactory/additional_attributes namespace. These attributes should not be taken into account when processing the input XML document, since they are discarded when the transformed document is serialized.

Restriction: Comments or processing instructions that are in any node before or after the root element cannot be modified by an XML Refactoring operation. In other words, XML Refactoring operations can only be performed on comments or processing instructions that are inside the root element.

Creating a Custom Refactoring Operation

To create a custom refactoring operation, follow these steps:

- **1.** Create an XQuery Update script or XSLT file.
- 2. Create an XML Refactoring Operation Descriptor file.
- 3. Store both files in *one of the locations that Oxygen XML Developer plugin* scans when loading the custom operations.

Once you run the **XML Refactoring** tool again, the custom operation appears in *the Refactoring operations wizard page*.

Custom Refactoring Script

The first step in creating a custom refactoring operation is to create an *XQuery Update script* or *XSLT stylesheet* that is needed to process the refactoring operations. The easiest way to create this script file is to use the **New** document wizard to create a new **XQuery** or **XSLT** file and you can use *our examples* to help you with the content.

There are cases when it is necessary to add parameters in the *XQuery script* or *XSLT stylesheet*. For instance, if you want to rename an element, you may want to declare an external parameter associated with the name of the element to be renamed. To allow you to specify the value for these parameters, they need to be declared in *the refactoring operation descriptor file* that is associated with this operation.

Note: The XQuery Update processing is disabled by default in Oxygen XML Developer plugin. Thus, if you want to create or edit an XQuery Update script you have to enable this facility by creating an *XQuery*

transformation scenario and choose **Saxon EE** as the transformation engine. Also, you need to make sure the **Enable XQuery update** option is enabled in the *Saxon processor advanced options*.

Note: If you are using an XSLT file, XPath expressions that are passed as parameters will automatically be rewritten to conform with the mapping of the namespace prefixes declared in the *XML/XSLT-FO-XQuery/XPath preferences page*.

The next step in creating a custom refactoring operation is to *create a custom operation descriptor file*.

Custom Refactoring Operation Descriptor File

The second step in creating a custom refactoring operation is to create an operation descriptor file. The easiest way to do this is to use the **New** document wizard and choose the **XML Refactoring Operation Descriptor** template.

Introduction to the Descriptor File

This file contains information (such as name, description, and id) that is necessarily when loading an XML Refactoring operation. It also contains the path to the XQuery Update script or XSLT stylesheet that is associated with the particular operation through the script element.

You can specify a category for your custom operations to logically group certain operations. The category element is optional and if it is not included in the descriptor file, the default name of the category for the custom operations is *Other operations*.

The descriptor file is edited and validated against the following schema: frameworks/xml_refactoring/operation_descriptor.xsd.

Declaring Parameters in the Descriptor File

If the XQuery Update script or XSLT stylesheet includes parameters, they should be declared in the **parameters** section of the descriptor file. All the parameters specified in this section of the descriptor file will be displayed in the **XML Refactoring** tool within *the Configure Operation Parameters wizard page* for that particular operation.

The value of the first description element in the **parameters** section will be displayed at the top of *the Configure Operation Parameters wizard page*.

To declare a parameter, specify the following information:

- label This value is displayed in the user interface for the parameter.
- name The parameter name used in the XQuery Update script or XSLT stylesheet and it should be the same as the one declared in the script.
- type Defines the type of the parameter and how it will be rendered. There are several types available:
 - TEXT Generic type used to specify a simple text fragment.
 - XPATH Type of parameter whose value is an XPATH expression. For this type of parameter, Oxygen XML Developer plugin will use a text input with corresponding content completion and syntax highlighting.
 - Note: The value of this parameter is transferred as plain text to the XQuery Update or XSLT transformation without being evaluated. You should evaluate the XPath expression inside the XQuery Update script or XSLT stylesheet. For example, you could use the saxon:evaluate Saxon extension function.
 - Note: A relative XPath expression is converted to an absolute XPath expression by adding // before it (//XPathExp). This conversion is done before transferring the XPath expression to the XML refactoring engine.
 - Note: When writing XPath expressions, you can only use prefixes declared in the *Options* > *Preferences* > *XML* > *XSLT-FO-XQUERY* > *XPath* options page.
 - NAMESPACE Used for editing namespace values.

- REG_EXP_FIND Used when you want to match a certain text by using Perl-like regular expressions.
- REG_EXP_REPLACE Used along with REG_EXP_FIND to specify the replacement string.
- XML_FRAGMENT This type is used when you want to specify an XML fragment. For this type, Oxygen XML Developer plugin will display a text area specialized for inserting XML documents.
- NC_NAME The parameter for NC_NAME values. It is useful when you want to specify the local part of a *QName* for an element or attribute.
- BOOLEAN Used to edit boolean parameters.
- TEXT_CHOICE It is useful for parameters whose value should be from a list of possible values. Oxygen XML Developer plugin renders each possible value as a radio button option.
- **description** The description of the parameter. It is used by the application to display a tooltip when you hover over the parameter.
- **possibleValues** Contains the list with possible values for the parameter and you can specify the default value, as in the following example:

Specialized Parameters to Match Elements or Attributes

If you want to match elements or attributes, you can use some specialized parameters, in which case Oxygen XML Developer plugin will propose all declared elements or attributes based on the schema associated with the currently edited file. The following specialized parameters are supported:

elementLocation

This parameter is used to match elements. For this type of parameter, the application displays a text field where you can enter the element name or an XPath expression. The text from the label attribute is displayed in the application as the label of the text field. The name attribute is used to specify the name of the parameter from the XQuery Update script or XSLT stylesheet. If the value of the useCurrentContext attribute is set to true, the element name from the cursor position is used as proposed values for this parameter.

Example of an elementLocation:

attributeLocation

This parameter is used to match attributes. For this type of parameter, the application displays two text fields where you can enter the parent element name and the attribute name (both text fields accept XPath expressions for a finer match). The text from the label attributes is displayed in the application as the label of the associated text fields. The name attribute is used to specify the name of the parameter from the XQuery Update script or XSLT stylesheet. The value of this parameter is an XPath expression that is computed by using the values of the expression from the element and attribute text fields. For example, if section is entered for the element and a title is entered for the attribute, the XPath expression would be computed as //section/@title. If the value of the useCurrentContext attribute is set to true, the element and attribute name from the cursor position is used as proposed values for the operation parameters.

Example of an attributeLocation:

```
</attribute>
</ AttributeLocation>
```

elementParameter

This parameter is used to specify elements by local name and namespace. For this type of parameter, the application displays two combo boxes with elements and namespaces collected from the associated schema of the currently edited file. The text from the label attribute is displayed in the application as label of the associated combo. The name attribute is used to specify the name of the parameter from the XQuery Update script or XSLT stylesheet. If you specify the allows Any attribute, the application will propose $\langle ANY \rangle$ as a possible value for the **Name** and Namespace combo boxes. You can also use the useCurrentContext attribute and if its value is set to true, the element name and namespace from the cursor position is used as proposed values for the operation parameters.

Example of an elementParameter:

```
<elementParameter id="elemID">
   <localName label="Name" name="element localName" allowsAny="true" useCurrentContext="true">
        <description>The local name of the attribute's parent element.</description>
   </localName>
   <namespace label="Namespace" name="element_namespace" allowsAny="true">
       <description>The local name of the attribute's parent element</description>
   </namespace>
</elementParameter>
```

attributeParameter

This parameter is used to specify attributes by local name and namespace. For this type of parameter, the application displays two combo boxes with attributes and their namespaces collected from the associated schema of the currently edited file. The text from the label attribute is displayed in the application as the label of the associated combo box. You can also use the useCurrentContext attribute and if its value is set to true, the attribute name and namespace from the cursor position is used as proposed values for the operation parameters.

Note: An attributeParameter is dependant upon an elementParameter. The list of attributes and namespaces are computed based on the selection in the elementParameter combo boxes.

Example of an attributeParameter:

```
<attributeParameter dependsOn="elemID">
   <localName label="Name" name="attribute_localName" useCurrentContext="true">
       <description>The name of the attribute to be converted.</description>
   </localName>
   <namespace label="Namespace" name="attribute_namespace" allowsAny="true">
       <description>The namespace of the attribute to be converted.</description>
   </namespace>
</attributeParameter>
```

Note: All predefined operations are loaded from the [OXYGEN_DIR]/refactoring folder.

Example of an XML Refactoring Operation

To demonstrate creating a custom operation, consider that we have a task where we need to convert an attribute into an element and insert it inside another element. A specific example would be if you have a project with a variety of image elements where a deprecated alt attribute was used for the description and you want to convert all instances of that attribute into an element with the same name and insert it as the first child of the image element.

Thus, our task is to convert this attribute into an element with the same name and insert it as the first child of the image element.

```
<image
     href="../image/insertBattery.jpg"
     alt="Insert the battery into the battery compartment."
     placement="break"/>
<image
     href="../image/insertBattery.jpg"
     pltement="break">
     <alt>Insert the battery into the battery compartment.</alt>
</image>
```

A new custom XML refactoring operation requires:

- An XQuery Update script or XSLT stylesheet.
- An XML Refactoring operation descriptor file that contains the path to the XQuery Update script or XSLT stylesheet.

Example of an XQuery Update Script for Creating a Custom Operation to Convert an Attribute to an Element

The XQuery Update script does the following:

- Iterates over all elements from the document that have the specified local name and namespace.
- Finds the attribute that will be converted to an element.
- Computes the *QName* of the new element to be inserted and inserts it as the first child of the parent element.

```

```

```
(: Compute the gname for the new element to insert :)

    if (empty($prefix) or $prefix[1] = '') then $new_element_localName else $prefix[1] | | ':' || $new_element_localName
  where ('<ANY>' = $element_localName or local-name($node) = $element_localName) and
         ($element_namespace = '<ANY>' or $element_namespace = namespace-uri($node))
  return
      if (exists($attribute)) then
          (insert node element {QName($new_element_namespace, $new_element_qName)}
{string($attribute)} as first into $node,
         delete node $attribute)
         else ()
```

Example of an XSLT Script for Creating a Custom Operation to Convert an Attribute to an Element

The XSLT stylesheet does the following:

- Iterates over all elements from the document that have the specified local name and namespace.
- Finds the attribute that will be converted to an element.
- Adds the new element as the first child of the parent element.

Note: The XSLT stylesheet imports a module library that contains utility functions and variables. The location of this module is resolved via an XML catalog set in the *XML Refactoring* framework.

Example of an Operation Descriptor File for Creating a Custom Operation to Convert an Attribute to an Element

After you have developed the XQuery script or XSLT stylesheet, you have to create an XML Refactoring operation descriptor. This descriptor is used by the application to load the operation details such as name, description, or parameters.

```
<?xml version="1.0" encoding="UTF-8"?>
<refactoringOperationDescriptor</pre>
    xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
    xmlns="http://www.oxygenxml.com/ns/xmlRefactoring"
    id="convert-attribute-to-element"
    name="Convert attribute to element">
   <description>Converts the specified attribute to an element. The new element will be inserted as first child
 of the attribute's parent element. </description>
       - For the XSLT stylesheet option uncomment the following line and comment the line referring the XQuery
    <!-- <script type="XSLT" href="convert-attribute-to-element.xsl"/> -->
    <script type="XQUERY_UPDATE" href="convert-attribute-to-element.xq"/>
   <parameters>
        <description>Specify the attribute to be converted to element.</description>
        <section label="Parent element">
           <elementParameter id="elemID">
               </localName>
               <namespace label="Namespace" name="element namespace" allowsAny="true">
                   <description>The local name of the attribute's parent element</description>
               </namespace>
           </elementParameter>
       </section>
        <section label="Attribute">
           <attributeParameter dependsOn="elemID">
               <localName label="Name" name="attribute localName">
                   <description>The name of the attribute to be converted.</description>
               </localName>
               <namespace label="Namespace" name="attribute_namespace" allowsAny="true">
                   <description>The namespace of the attribute to be converted.</description>
               </namespace>
           </attributeParameter>
       </section>
        <section label="New element">
           <elementParameter>
               <localName label="Name" name="new_element_localName">
                   <description>The name of the new element.</description>
               </localName>
               <namespace label="Namespace" name="new_element_namespace">
                   <description>The namespace of the new element.</description>
               </namespace>
           </elementParameter>
       </section>
    </parameters>
</refactoringOperationDescriptor>
```

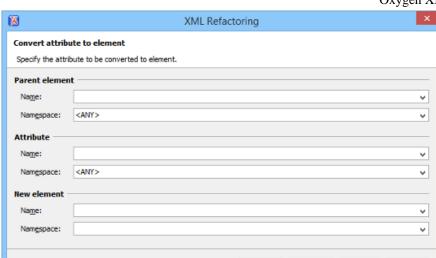

Note: If you are using an XSLT file, the line with the script element would look like this:

```
<script type="XSLT" href="convert-attribute-to-element.xsl"/>
```

Results

After you have created these files, copy them into a folder *scanned by Oxygen XML Developer plugin when it loads the custom operation*. When the XML Refactoring tool is started again, you will see the created operation.

Since various parameters can be specified, this custom operation can also be used for other similar tasks. The following image shows the parameters that can be specified in our example of the custom operation to convert an attribute to an element:

Storing and Sharing Refactoring Operations

Oxygen XML Developer plugin scans the following locations when looking for XML Refactoring operations to provide flexibility:

Next >

Finish

Cancel

• A refactoring folder, created inside a directory that is associated to a *framework* you are customizing.

< Back

- Any folder. In this case, you need to *open the Preferences dialog box*, go to **XML** > **XML Refactoring**, and specify the same folder in the **Load additional refactoring operations from** text box.
- The refactoring folder from the Oxygen XML Developer plugin installation directory ([OXYGEN INSTALLATION DIRECTORY]/refactoring/).

Sharing Custom Refactoring Operations

The purpose of Oxygen XML Developer plugin scanning multiple locations for the XML Refactoring operations is to provide more flexibility for developers who want to share the refactoring operations with the other team members. Depending on your particular use case, you can attach the custom refactoring operations to other resources, such as frameworks or projects.

After storing custom operations, you can share them with other users by sharing the resources.

Localizing XML Refactoring Operations

Oxygen XML Developer plugin includes localization support for the XML refactoring operations.

The translation keys for the built-in refactoring operations are located in [OXYGEN INSTALLATION DIRECTORY]/refactoring/il8n/translation.xml.

The localization support is also available for custom refactoring operations. The following information can be translated:

- The operation name, description, and category.
- The description of the parameters element.
- The label, description, and possible Values for each parameter.

Translated refactoring information uses the following form:

\${i18n(translation_key)}

Oxygen XML Developer plugin scans the following locations to find the translation.xml files that are used to load the translation keys:

- A refactoring/i18n folder, created inside a directory that is associated to a customized framework.
- A i18n folder, created inside a directory that is associated to a customized framework.

- An i18n folder inside any specified folder. In this case, you need to *open the Preferences dialog box*, go to XML > XML Refactoring, and specify the folder in the Load additional refactoring operations from text box.
- The refactoring/i18n folder from the Oxygen XML Developer plugin installation directory ([OXYGEN INSTALLATION DIRECTORY]/refactoring/i18n).

Editing XSLT Stylesheets

This section explains the features of the XSLT editor.

To watch our video demonstration about basic XSLT editing and transformation scenarios in Oxygen XML Developer plugin, go to http://oxygenxml.com/demo/XSL_Editing.html.

Validating XSLT Stylesheets

Oxygen XML Developer plugin performs the validation of XSLT documents with the help of an XSLT processor that you can configure in the preferences pages according to the XSLT version. For XSLT 1.0, the options are: Xalan, Saxon 6.5.5, Saxon 9.6.0.7 and a JAXP transformer specified by the main Java class. For XSLT 2.0, the options are: Saxon 9.6.0.7 and a JAXP transformer specified by the main Java class. For XSLT 3.0, the options are Saxon 9.6.0.7 and a JAXP transformer specified by the main Java class.

Creating a Validation Scenario for XSLT Stylesheets

You can validate an XSLT document using the engine defined in the transformation scenario, or a custom validation scenario. If you choose to validate using the engine from transformation scenario, and a transformation scenario is not associated with the current document or the engine has no validation support, the default engine is used. To set the default engine, *open the Preferences dialog box* and go to XML > XSLT/FO/XQuery > XSLT.

You can also create new validation scenarios or edit existing ones, and you can add jars and classes that contain extension functions. To create or edit a validation scenario for an XSLT stylesheet, follow these steps:

- 1. With the XSLT file opened in Oxygen XML Developer plugin, select the Configure Validation Scenario(s) from the XML menu, or the toolbar, or from the Validate submenu when invoking the contextual menu on the XSLT file in the Navigator view.
 - The **Configure Validation Scenario(s)** dialog box is displayed. It contains the existing scenarios, organized in categories depending on the type of file they apply to. You can use the options in the **Settings** drop-down menu to filter which scenarios are shown.
- **2.** To edit an existing scenario, select the scenario and press the **Edit** button. If you try to edit one of the *read-only* predefined scenarios, Oxygen XML Developer plugin creates a customizable duplicate (you can also use the **Duplicate** button).

To add a new scenario, press the * New button. The **New scenarios** dialog box is displayed. It lists all validation units of the scenario.

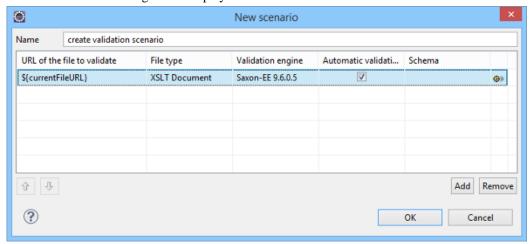

Figure 66: Add / Edit a Validation Unit

- **4.** Configure the following information in this dialog box:
 - a) Name The name of the validation scenario.
 - b) URL of the file to validate In most cases leave this field as the default selection (the URL of the current file). If you want to specify a different URL, click its cell and enter the URL in the text field, select it from the drop-down list, or use the Towse drop-down menu or Insert Editor Variable button.
 - c) File type The file type should be XSLT Document.
 - d) Validation engine Click the cell to select a validation engine. You must select an engine to be able to add or edit extensions.
 - e) Automatic validation If this option is checked, the validation operation defined by this row is also used by the automatic validation feature.
- 5. To add or edit extensions, click the 👺 Edit extensions button. This button is only available if the File type is set as XSLT Document and a Validation engine is chosen. The Libraries dialog box is opened. It is used to specify the jars and classes that contain extension functions called from the XSLT file of the current validation scenario. They will be searched, in the specified extensions, in the order displayed in this dialog box. To change the order of the items, select the item and press the **1** Move up or **4** Move down buttons.
- **6.** Press **OK** to close the **New scenario** dialog box. The newly created validation scenario is now included in the list of scenarios in the Configure Validation Scenario(s) dialog box. You can select the scenario in this dialog box to associate it with the current XSLT document and press the **Apply associated** button to run the validation scenario.

Validating XSLT Stylesheets with Custom Engines

If you need to validate an XSLT stylesheet with a validation engine that is different from the built-in engine, you can configure external engines as custom XSLT validation engines in the Oxygen XML Developer plugin preferences. After a custom validation engine is properly configured, it can be applied on the current document by selecting it from the list of custom validation engines in the 📝 * Validation toolbar drop-down menu. The document is validated against the schema declared in the document.

By default, there are two validators that are configured for XSLT stylesheets:

- MSXML 4.0 included in Oxygen XML Developer plugin (Windows edition). It is associated to the XSL Editor type in *Preferences page*.
- MSXML.NET included in Oxygen XML Developer plugin (Windows edition). It is associated to the XSL Editor type in *Preferences page*.

Smaller interrelated modules that define a complex stylesheet cannot be correctly edited or validated individually, due to their interdependency with other modules. For example, a function defined in a main stylesheet is not visible when you edit an included or imported module. Oxygen XML Developer plugin provides the support for defining the main module (or modules), allowing you to edit any of the imported/included files in the context of the larger stylesheet structure.

You cat set a main XSLT stylesheet either using the *master files support from the Navigator view*, or using a validation scenario.

To set a main file using a validation scenario, add validation units that point to the main modules. Oxygen XML Developer plugin warns you if the current module is not part of the dependencies graph computed for the main stylesheet. In this case, it considers the current module as the main stylesheet.

The advantages of editing in the context of main file include:

- Correct validation of a module in the context of a larger stylesheet structure.
- Content Completion Assistant displays all components valid in the current context.
- The **Outline** displays the components collected from the entire stylesheet structure.

To watch our video demonstration about editing XSLT stylesheets in the master files context, go to http://oxygenxml.com/demo/MasterFilesSupport.html.

Syntax Highlight

The XSL editor renders the CSS and JS scripts, and XPath expressions with dedicated coloring schemes. To customize the coloring schemes, *open the Preferences dialog box* and go to Editor > Syntax Highlight.

Content Completion in XSLT Stylesheets

The items in the list of proposals offered by the **Content Completion Assistant** are context-sensitive. The proposed items are valid at the current cursor position. You can enhance the list of proposals by specifying an additional schema. This schema is *defined by the user in the Content Completion / XSL preferences* page and can be: XML Schema, DTD, RELAX NG schema, or NVDL schema.

```
<xsl:element name="table">
   <xsl:attribute name="border">1</xsl:attribute>

              <b>Email</b>
           </font>
```

Figure 67: XSLT Content Completion Window

The **Content Completion Assistant** proposes numerous item types (such as templates, variables, parameters, keys, etc.) that are defined in the current stylesheet, and in the imported and included XSLT stylesheets. The **Content Completion Assistant** also includes *code templates that can be used to quickly insert code fragments* into stylesheets.

Note: For XSL and XSD resources, the **Content Completion Assistant** collects its components starting from the master files. The master files can be defined in the project or in the associated validation scenario. For further details about the **Master Files** support go to *Defining Master Files at Project Level*.

The extension functions built in the Saxon 6.5.5 and 9.6.0.7 transformation engines are presented in the content completion list only if the Saxon namespace (http://saxon.sf.net for XSLT version 2.0 / 3.0 or http://icl.com/saxon for XSLT version 1.0) is declared and one of the following conditions is true:

- The edited file has a transformation scenario that uses as transformation engine Saxon 6.5.5 (for XSLT version 1.0), Saxon 9.6.0.7 PE or Saxon 9.6.0.7 EE (for XSLT version 2.0 / 3.0).
- The edited file has a validation scenario that uses as validation engine Saxon 6.5.5 (for version 1.0), Saxon 9.6.0.7 PE or Saxon 9.6.0.7 EE (for version 2.0 / 3.0).
- The validation engine specified in *Options* page is Saxon 6.5.5 (for version 1.0), Saxon 9.6.0.7 PE or Saxon 9.6.0.7 EE (for version 2.0 / 3.0).

Additionally. the Saxon-CE-specific extension functions and instructions are presented in the Content Completion Assistant's proposals list only if the http://saxonica.com/ns/interactiveXSLT namespace is declared.

Namespace prefixes in the scope of the current context are presented at the top of the content completion window to speed up the insertion into the document of prefixed elements.

```
<xsl:template match="*">
 </xsl 🔭 fo:
                                                         Namespace prefix.
        T rx:
⊝<xsl: Exsl:
         🖁 fo:basic-link
   fo:bidi-override
   <xs fo:block
      < ti>fo:block-container
        fo:character
         🖫 fo:color-profile
        🏗 fo:conditional-page-master-reference
        fo:declarations
      <xsl:when test="contains($rowval,'main')">
        <xsl:call-template name="trans-level">
           <xsl:with-param name="rowval"><xsl:value-of select="concat()"</pre>
        </xsl:call-template>
      </xsl:when>
```

Figure 68: Namespace Prefixes in the Content Completion Window

For the common namespaces like XSL namespace (http://www.w3.org/1999/XSL/Transform), XML Schema namespace (http://www.w3.org/2001/XMLSchema) or Saxon namespace (http://icl.com/saxon for version 1.0, http://saxon.sf.net/for version 2.0/3.0), Oxygen XML Developer plugin provides an easy mode to declare them by proposing a prefix for these namespaces.

Content Completion in XPath Expressions

In XSLT stylesheets, the **Content Completion Assistant** provides *all the features available in the XML editor* and also adds some enhancements. In XPath expressions used in attributes of XSLT stylesheets elements like match, select and test, the **Content Completion Assistant** offers the names of XPath and XSLT functions, the XSLT axes, and user-defined functions (the name of the function and its parameters). If a transformation scenario was defined and associated to the edited stylesheet, the **Content Completion Assistant** computes and presents elements and attributes based on:

- The input XML document selected in the scenario.
- The current context in the stylesheet.

The associated document is displayed in the XSLT/XQuery Input view.

Content completion for XPath expressions is started:

- On XPath operators detected in one of the match, select and test attributes of XSLT elements: ", ', /, //, (, [, |, :, ::, \$
- For attribute value templates of non-XSLT elements, that is the { character when detected as the first character of
 the attribute value.
- On request, if the combination <u>Ctrl Space (Command Space on OS X)</u> is pressed inside an edited XPath expression.

The items presented in the content completion window are dependent on:

- The context of the current XSLT element.
- The XML document associated with the edited stylesheet in the stylesheet transformation scenario.
- The XSLT version of the stylesheet (1.0, 2.0, or 3.0).

Note: The XSLT 3.0 content completion list of proposals includes specific elements and attributes for the 3.0 version.

For example, if the document associated with the edited stylesheet is:

```
<personnel>
   <person id="Big.Boss">
       <name>
           <family>Boss</family>
           <given>Big</given>
       </name>
       <email>chief@oxygenxml.com
       <link subordinates="one.worker"/>
   </person>
   <person id="one.worker">
       <name>
           <family>Worker</family>
           <given>One</given>
       </name>
       <email>one@oxygenxml.com
       <link manager="Big.Boss"/>
   </person>
</personnel>
```

If you enter an xsl:template element using the content completion assistant, the following actions are triggered:

- The match attribute is inserted automatically.
- The cursor is placed between the quotes.
- The XPath Content Completion Assistant automatically displays a popup window with all the XSLT axes, XPath functions and elements and attributes from the XML input document that can be inserted in the current context.

The set of XPath functions depends on the XSLT version declared in the root element xsl:stylesheet: 1.0, 2.0 or 3.0.

Figure 69: Content Completion in the match Attribute

If the cursor is inside the select attribute of an xsl:for-each, xsl:apply-templates, xsl:value-of or xsl:copy-of element the content completion proposals depend on the path obtained by concatenating the XPath expressions of the parent XSLT elements xsl:template and xsl:for-each as shown in the following figure:

Figure 70: Content Completion in the select Attribute

Also XPath expressions typed in the test attribute of an xsl:if or xsl:when element benefit of the assistance of the content completion.

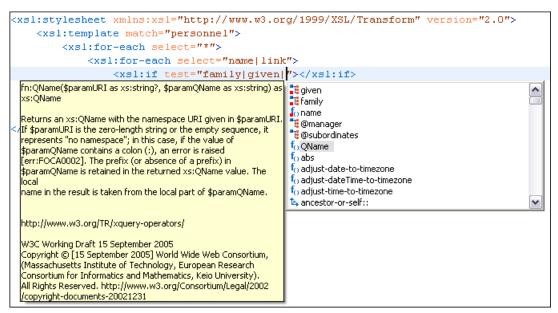

Figure 71: Content Completion in the test Attribute

XSLT variable references are easier to insert in XPath expressions with the help of the content completion popup triggered by the \$ character which signals the start of such a reference in an XPath expression.

Figure 72: Content Completion in the test Attribute

If the { character is the first one in the value of the attribute, the same Content Completion Assistant is available also in attribute value templates of non-XSLT elements.

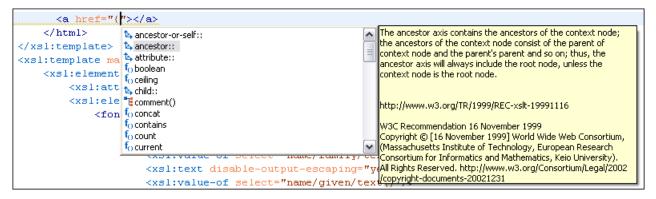

Figure 73: Content Completion in Attribute Value Templates

The time delay *configured in Preferences* page for all content completion windows is applied also for the XPath expressions content completion window.

Tooltip Helper for the XPath Functions Arguments

When editing the arguments of an XPath/XSLT function, Oxygen XML Developer plugin tracks the current entered argument by displaying a tooltip containing the function signature. The currently edited argument is highlighted with a bolder font.

When moving the cursor through the expression, the tooltip is updated to reflect the argument found at the cursor position.

```
We want to concatenate the absolute values of two variables, named v1 and v2.
 <xsl:template match="/">
     <xsl:value-of select="concat(abs($v1), abs($v2))"></xsl:value-of>
 </xsl:template>
```

When moving the cursor before the first abs function, Oxygen XML Developer plugin identifies it as the first argument of the concat function. The tooltip shows in bold font the following information about the first argument:

- Its name is \$arg1.
- Its type is xdt: anyAtomicType.
- It is optional (note the? sign after the argument type).

The function takes also other arguments, having the same type, and returns a xs:string.

```
concat($arg1 as xdt:anyAtomicType?, $arg2 as xdt:anyAtomicType?, ...) as xs:string
elect="concat(abs($v1), abs($v2))|"></xsl:value-of>
      </x>l:template>
l:stylesheet>
```

Figure 74: XPath Tooltip Helper - Identify the concat Function's First Argument

Moving the cursor on the first variable \$v1, the editor identifies the abs as context function and shows its signature:

```
name="v2" se
abs($arg as numeric?) as numeric?
elect="concat(abs($v1), abs($v2))"></xsl:value-of>

/xsl:template>
:l:stvlesheet>
```

Figure 75: XPath Tooltip Helper - Identify the abs Function's Argument

Further, clicking the second abs function name, the editor detects that it represents the second argument of the concat function. The tooltip is repainted to display the second argument in bold font.

```
concat($arg1 as xdt:anyAtomicType?, $arg2 as xdt:anyAtomicType?, ...) as xs:string
elect="concat(abs($v1), abs($v2))"></xsl:value-of>
       </xsl:template>
:l:stylesheet>
```

Figure 76: XPath Tooltip Helper - Identify the concat Function's Second Argument

The tooltip helper is available also in the XPath toolbar and the XPath Builder view.

The XSLT/XQuery Input View

The structure of the XML document associated to the edited XSLT stylesheet, or the structure of the source documents of the edited XQuery is displayed in a tree form in a view called XSLT/XQuery Input. The tree nodes represent the elements of the documents.

The XSLT Input View

If you click a node, the corresponding template from the stylesheet is highlighted. A node can be dragged from this view and dropped in the editor area for quickly inserting xsl:template, xsl:for-each, or other XSLT elements that have the match/select/test attribute already completed. The value of the attribute is the correct XPath expression that refers to the dragged tree node. This value is based on the current editing context of the drop spot.

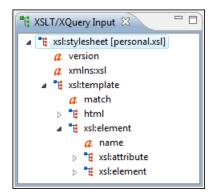

Figure 77: XSLT Input View

```
For example, for the following XML document:
 <personnel>
     <person id="Big.Boss">
         <name>
             <family>Boss</family>
             <given>Big</given>
         </name>
         <email>chief@oxygenxml.com
         <link subordinates="one.worker"/>
     <person id="one.worker">
         <name>
             <family>Worker</family>
             <given>One</given>
         <email>one@oxygenxml.com</email>
         <link manager="Big.Boss"/>
     </person>
 </personnel>
```

and the following XSLT stylesheet:

```
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
    version="2.0">
    <xsl:template match="personnel">
        <xsl:for-each select="*">
        </xsl:for-each>
        </xsl:template>
</xsl:stylesheet>
```

if you drag the given element and drop it inside the xsl:for-each element, the following pop-up menu is displayed:

Figure 78: XSLT Input Drag and Drop Pop-up Menu

Select for example **Insert xsl:value-of** and the result document is:

Figure 79: XSLT Input Drag and Drop Result

The XSLT Outline View

The XSLT **Outline** view displays the list of all the components (templates, attribute-sets, character-maps, variables, functions, keys, outputs) from both the edited stylesheet and its imports or includes. For XSL and XSD resources, the **Outline** view collects its components starting from the master files. The master files can be defined in the project or in the associated validation scenario. For further details about the **Master Files** support go to *Defining Master Files at Project Level*. To enable the **Outline** view, go to **Window** > **Show View** > **Outline**.

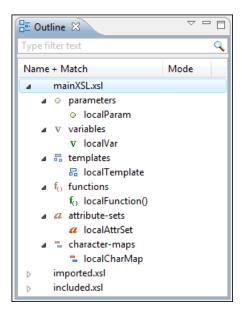

Figure 80: The XSLT Outline View

The following actions are available in the View Menu on the Outline view action bar:

Filter returns exact matches

The text filter of the **Outline** view returns only exact matches;

Selection update on cursor move

Controls the synchronization between **Outline** view and source document. The selection in the **Outline** view can be synchronized with the cursor moves or the changes in the XSLT editor. Selecting one of the components from the **Outline** view also selects the corresponding item in the source document.

When the **Show components** option is selected, the following actions are available:

Show XML structure

Displays the XML document structure in a tree-like structure.

Show all components

Displays all components that were collected starting from the main file. This option is set by default.

Show only local components

Displays the components defined in the current file only.

Group by location/type

The stylesheet components can be grouped by location and type.

When the **Show XML structure** option is selected, the following actions are available:

Show components

Switches the **Outline** view to the components display mode.

Flat presentation mode of the filtered results

When active, the application flattens the filtered result elements to a single level.

Show comments and processing instructions

Show/hide comments and processing instructions in the **Outline** view.

Show element name

Show/hide element name.

T Show text

Show/hide additional text content for the displayed elements.

Show attributes

Show/hide attribute values for the displayed elements. The displayed attribute values can be changed from *the Outline preferences panel*.

Configure displayed attributes

Displays the XML Structured Outline preferences page.

The following contextual menu actions are also available when the **Show components** option is selected in the **View menu**:

Edit Attributes

Opens a small in-place editor that allow you to edit the attributes of the selected node.

& Cut

Cuts the currently selected node.

Сору

Copies the currently selected node.

× Delete

Deletes the currently selected node.

Search References Ctrl Shift R (Meta Shift R on OS X)

Searches all references of the item found at current cursor position in the defined scope, if any. See *Finding XSLT References and Declarations* for more details.

Search References in

Searches all references of the item found at current cursor position in the specified scope. See *Finding XSLT References and Declarations* for more details.

Component Dependencies

Allows you to see the dependencies for the current selected component. See *Component Dependencies View* for more details.

Resource Hierarchy

Displays the hierarchy for the currently selected resource.

Resource Dependencies

Displays the dependencies of the currently selected resource.

Rename Component in

Renames the selected component. See XSLT Refactoring Actions for more details.

The following contextual menu actions are available in the **Outline** view when the **Show XML structure** option is selected in the **View menu**:

Append Child

Displays a list of elements that you can insert as children of the current element.

Insert Before

Displays a list of elements that you can insert as siblings of the current element, before the current element.

Insert After

Displays a list of elements that you can insert as siblings of the current element, after the current element.

Edit Attributes

Opens a small in-place editor that allow you to edit the attributes of the selected node.

→! Toggle Comment

Comments/uncomments the currently selected element.

Search references

Searches for the references of the currently selected component.

Search references in

Searches for the references of the currently selected component in the context of a scope that you define.

Component dependencies

Displays the dependencies of the currently selected component.

Rename Component in

Renames the currently selected component in the context of a scope that you define.

& Cut

Cuts the currently selected component.

Copies the currently selected component.

Delete

Deletes the currently selected component.

Expand All

Expands the structure of a component in the **Outline** view.

Collapse All

Collapses the structure of all the component in the **Outline** view.

The stylesheet components information is presented on two columns: the first column presents the name and match attributes, the second column the mode attribute. If you know the component name, match or mode, you can search it in the **Outline** view by typing one of these pieces of information in the filter text field from the top of the view or directly on the tree structure. When you type de component name, match or mode in the text field, you can switch to the tree structure using:

- Keyboard arrow keys
- Enter key
- Tab key
- Shift-Tab key combination

To switch from tree structure to the filter text field, you can use **Tab** and **Shift-Tab**.

- ? any character
- , patterns separator

If no wildcards are specified, the string to search is used as a partial match (like *textToFind*).

The content of the Outline view and the editing area are synchronized. When you select a component in the Outline view, its definition is highlighted in the editing area.

Oxygen XML Developer plugin allows you to sort the components of the tree in the **Outline** view.

Tip: The search filter is case insensitive. The following wildcards are accepted:

Oxygen XML Developer plugin has a predefined order of the groups in the **Outline** view:

- For location, the names of the files are sorted alphabetically. The main file is the one you are editing and it is located at the top of the list.
- For type, the order is: parameters, variables, templates, functions, set attributes, character-map.

Note: When no grouping is available and the table is not sorted, Oxygen XML Developer plugin sorts the components depending on their order in the document. Oxygen XML Developer plugin also takes into account the name of the file that the components are part of.

XSLT Stylesheet Documentation Support

Oxygen XML Developer plugin offers built-in support for documenting XSLT stylesheets. If the expanded *QName* of the element has a non-null namespace URI, the xsl:stylesheet element may contain any element not from the XSLT namespace. Such elements are referenced as user-defined data elements. Such elements can contain the documentation for the stylesheet and its elements (top-level elements whose names are in the XSLT namespace). Oxygen XML Developer plugin offers its own XML schema that defines such documentation elements. The schema is named stylesheet_documentation.xsd and can be found in

[OXYGEN_DIR]/frameworks/stylesheet_documentation. The user can also specify a custom schema in XSL Content Completion options.

When content completion is invoked inside an XSLT editor by pressing <u>Ctrl Space (Command Space on OS X)</u>, it offers elements from the XSLT documentation schema (either the built-in one or one specified by user).

In **Text** mode, to add documentation blocks while editing use the **Add component documentation** action available in the contextual menu.

If the cursor is positioned inside the xsl:stylesheet element context, documentation blocks are generated for all XSLT elements. If the cursor is positioned inside a specific XSLT element (like a template or a function), a documentation block is generated for that element only.

```
Example of a documentation block using Oxygen XML Developer plugin built-in schema
    <xd:desc>
      \verb|<xd:p>Search| inside parameter < xd:i>string</xd:i> for the last occurrence of parameter |
      <xd:i>searched</xd:i>. The substring starting from the 0 position to the identified last
occurrence will be returned. <xd:ref name="f:substring-after-last" type="function"</pre>
 xmlns:f="http://www.oxygenxml.com/doc/xsl/functions">See also</xd:ref></xd:p>
    </xd:desc>
    <xd:param name="string">
      <xd:p>String to be analyzed</xd:p>
    </xd:param>
    <xd:param name="searched">

    </xd:param>
    <xd:return>
      <ad:p>A substring starting from the beginning of <ad:i>string</ad:i> to the last

      returned.</xd:p>

Generating Documentation for an XSLT Stylesheet

You can use Oxygen XML Developer plugin to generate detailed documentation in HTML format for the elements (top-level elements whose names are in the XSLT namespace) of an XSLT stylesheet. You are able to select what XSLT elements to include in the generated documentation and also the level of details to present for each of them. The elements are hyperlinked. To generate documentation in a *custom output format*, you can edit the XSLT stylesheet used to generate the documentation, or create your own stylesheet.

To open the XSLT Stylesheet Documentation dialog box, select XSLT Stylesheet Documentation from the XML Tools > Generate Documentation menu or from the Generate Stylesheet Documentation action from the contextual menu of the Navigator view.

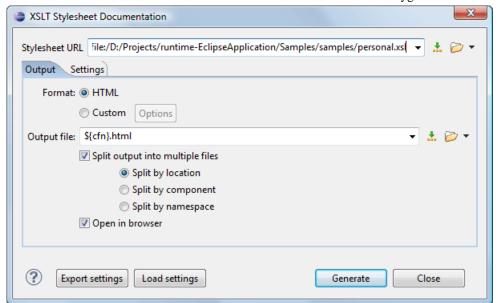

Figure 81: The XSLT Stylesheet Documentation Dialog Box

The **XSL URL** field of the dialog box must contain the full path to the XSL Stylesheet file you want to generate documentation for. The stylesheet may be a local or a remote file. You can specify the path to the stylesheet by entering it in the text field, or by using the **! Insert Editor Variables** button or the options in the **! * Browse** drop-down menu.

The Output Tab

The following options are available in the **Output** tab:

- **Format** Allows you to choose between the following formats:
 - **HTML** The documentation is generated in *HTML output format*.
 - **Custom** The documentation is generated in a *custom output format*, allowing you to control the output. Click the **Options** button to open a **Custom format options** dialog box where you can specify a custom stylesheet for creating the output. There is also an option to **Copy additional resources to the output folder** and you can select the path to the additional **Resources** that you want to copy. You can also choose to keep the intermediate XML files created during the documentation process by deselecting the **Delete intermediate XML file** option.
- Output file You can specify the path of the output file by entering it in the text field, or by using the ... Insert Editor Variables button or the options in the : Browse drop-down menu.
- **Split output into multiple files** Instructs the application to split the output into multiple files. For large XSLT stylesheets being documented, choosing a different split criterion may generate smaller output files providing a faster documentation browsing. You can choose to split them by namespace, location, or component name.
- **Open in Browser/System Application** Opens the result in the system application associated with the output file type.

Note: To set the browser or system application that will be used, *open the Preferences dialog box*, then go to **General** > **Web Browser**. This will take precedence over the default system application settings.

The Settings Tab

When you generate documentation for an XSLT stylesheet you can choose what XSLT elements to include in the output (templates, functions, global parameters, global variables, attribute sets, character maps, keys, decimal formats, output formats, XSLT elements from referenced stylesheets) and the details to include in the documentation.

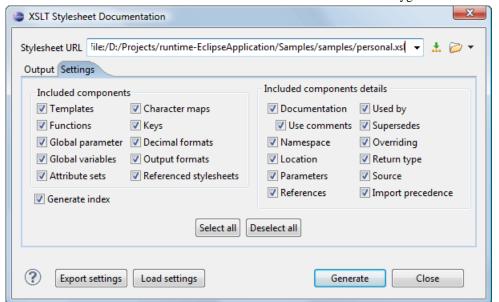

Figure 82: The Settings Tab of the XSLT Stylesheet Documentation Dialog Box

The **Settings** tab allows you to choose whether or not to include the following components: **Templates**, **Functions**, **Global parameters**, **Global variables**, **Attribute sets**, **Character maps**, **Keys**, **Decimal formats**, **Output formats**, **Referenced stylesheets**.

You can choose whether or not to include the following other details:

- **Documentation** Shows the documentation for each XSLT element. For HTML format, the user-defined data elements that are recognized and transformed in documentation blocks of the XSLT elements they precede, are the ones from the following schemas:
 - Oxygen XML Developer plugin built-in XSLT documentation schema.
 - A subset of DocBook 5 elements. The recognized elements are: section, sect1 to sect5, emphasis, title, ulink, programlisting, para, orderedlist, itemizedlist.
 - A subset of DITA elements. The recognized elements are: concept, topic, task, codeblock, p, b, i, ul, ol, pre, sl, sli, step, steps, li, title, xref.
 - Full XHTML 1.0 support.
 - XSLStyle documentation environment. XSLStyle uses DocBook or DITA languages inside its own user-defined data elements. The supported DocBook and DITA elements are the ones mentioned above.
 - Doxsl documentation framework. Supported elements are: codefrag, description, para, docContent, documentation, parameter, function, docSchema, link, list, listitem, module, parameter, template, attribute-set;

Other XSLT documentation blocks that are not recognized will just be serialized inside an HTML pre element. You can change this behavior by using a *custom format* instead of the built-in *HTML format* and providing your own XSLT stylesheets.

- Use comments Controls whether or not the comments that precede an XSLT element is treated as documentation for the element they precede. Comments that precede or succeed the xsl:stylesheet element, are treated as documentation for the whole stylesheet. Note that comments that precede an import or include directive are not collected as documentation for the imported/included module. Also, comments from within the body of the XSLT elements are not collected at all.
- Namespace Shows the namespace for named XSLT elements.
- Location Shows the stylesheet location for each XSLT element.
- **Parameters** Shows parameters of templates and functions.
- **References** Shows the named XSLT elements that are referenced from within an element.

- Used by Shows the list of all the XSLT elements that reference the current named element.
- Supersedes Shows the list of all the XSLT elements that are superseded the current element.
- Overriding Shows the list of all the XSLT elements that override the current element.
- **Return type** Shows the return type of the function.
- Source Shows the text stylesheet source for each XSLT element.
- Import precedence Shows the computed import precedence as declared in the XSL transformation specifications.
- Generate index Creates an index with all the XSLT elements included in the documentation.

Export settings - Save the current settings in a settings file for further use (for example, with the exported settings file you can generate the same *documentation from the command-line interface*.)

Load settings - Reloads the settings from the exported file.

Generate - Use this button to generate the XSLT documentation.

Generate XSLT Documentation in HTML Format

The XSLT documentation generated in HTML format is presented in a visual diagram style with various sections, hyperlinks, and options.

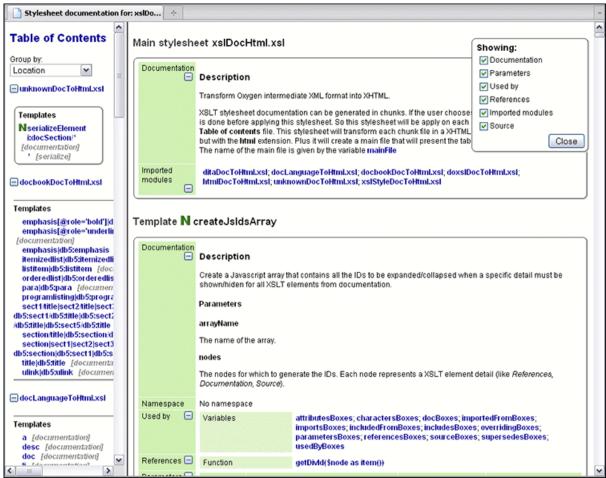

Figure 83: XSLT Stylesheet Documentation Example

The generated documentation includes the following:

- Table of Contents You can group the contents by namespace, location, or component type. The XSLT elements from each group are sorted alphabetically (named templates are presented first and the match ones second).
- Information about main, imported, and included stylesheets. This information consists of:
 - XSLT modules included or imported by the current stylesheet.

- The XSLT stylesheets where the current stylesheet is imported or included.
- The stylesheet location.

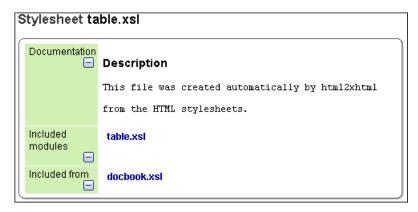

Figure 84: Information About an XSLT Stylesheet

If you choose to split the output into multiple files, the table of contents is displayed in the left frame. The contents are grouped using the same criteria as the split.

After the documentation is generated, you can collapse or expand details for some stylesheet XSLT elements by using the **Showing** options or the **Collapse** or **Expand** buttons.

Figure 85: The Showing Options

For each element included in the documentation, the section presents the element type followed by the element name (value of the name or match attribute for match templates).

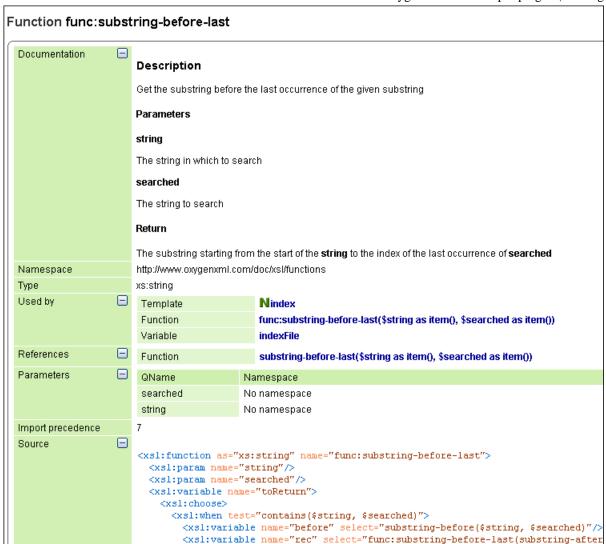

Figure 86: Documentation for an XSLT Element

Generate XSLT Documentation in a Custom Format

<xsl:choose>

XSLT stylesheet documentation can be also generated in a custom format. You can choose the format from the XSLT Stylesheet Documentation dialog box. Specify your own stylesheet to transform the intermediary XML generated in the documentation process. You must write your stylesheet based on the schema xslDocSchema.xsd from [OXYGEN_DIR]/frameworks/stylesheet_documentation. You can create a custom format starting from one of the stylesheets used in the predefined HTML, PDF, and DocBook formats. These stylesheets are available in [OXYGEN_DIR]/frameworks/stylesheet_documentation/xsl.

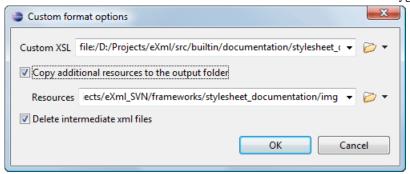

Figure 87: The Custom Format Options Dialog Box

When using a custom format, you can also copy additional resources into the output folder or choose to keep the intermediate XML files created during the documentation process.

Generating XSLT Documentation From the Command-Line Interface

You can export the settings of the **XSLT Stylesheet Documentation** dialog box to an XML file by pressing the **Export settings** button. With the exported settings file, you can generate the same documentation from the command line by running the script stylesheetDocumentation.bat (on Windows) / stylesheetDocumentation.sh (on OS X / Unix / Linux) located in the Oxygen XML Developer plugin installation folder. The script can be integrated in an external batch process launched from the command-line interface.

The command-line parameter of the script is the relative path to the exported XML settings file. The files that are specified with relative paths in the exported XML settings are resolved relative to the script directory.

Finding XSLT References and Declarations

The following search actions related with XSLT references and declarations are available from the **Search** submenu of the contextual menu:

- Search References (Also available from the XSL menu) Searches all references of the item found at current cursor position in the defined scope, if any. If a scope is defined but the currently edited resource is not part of the range of determined resources, a warning dialog box is displayed that allows you to define another search scope.
- Search References in Searches all references of the item found at current cursor position in the file or files that you specify when a scope is defined.
- Search Declarations (Also available from the XSL menu) Searches all declarations of the item found at current cursor position in the defined scope, if any. If a scope is defined but the current edited resource is not part of the

range of resources determined by this scope, a warning dialog box is displayed that allows you to define another search scope.

- Search Declarations in Searches all declarations of the item found at current cursor position in the file or files that you specify when a scope is defined.
- Search Occurrences in File Searches all occurrences of the item at the cursor position in the currently edited file.

The following action is available from the **XSL** menu:

- Show Definition Moves the cursor to the location of the definition of the current item.
 - Note: You can also use the <u>Ctrl Single-Click (Command Single-Click on OS X)</u> shortcut on a reference to display its definition.

Highlight Component Occurrences

When a component (for example variable or named template) is found at current cursor position, Oxygen XML Developer plugin performs a search over the entire document to find the component declaration and all its references. When found, they are highlighted both in the document and in the stripe bar, at the right side of the document.

Note: Oxygen XML Developer plugin also supports occurrences highlight for template modes.

Customizable colors are used: one for the component definition and another one for component references. Occurrences are displayed until another component is selected and a new search is performed. All occurrences are removed when you start to edit the document.

This feature is enabled by default. To configure it, *open the Preferences dialog box* and go to **Editor** > **Mark Occurrences**. A search can also be triggered with the **Search** > **Search Occurrences in File** (**Ctrl Shift U (Meta Shift U on OS X)**) contextual menu action. Matches are displayed in separate tabs of the **Results** view.

XSLT Refactoring Actions

Oxygen XML Developer plugin offers a set of actions that allow changing the structure of an XSLT stylesheet without changing the results of running it in an XSLT transformation. Depending on the selected text, the following refactoring actions are available from **Refactoring** submenu from the contextual menu of the current editor:

- Extract template Extracts the selected XSLT instructions sequence into a new template. Opens a dialog box that allows you to specify the name of the new template to be created. The possible changes to perform on the document can be previewed before altering the document. After pressing OK, the template is created and the selection is replaced with a <xsl:call-template> instruction referencing the newly created template.
 - Note: This action is available only when the selection contains well-formed elements.
 - **Note:** The newly created template is indented and its name is highlighted in the <xsl:call-template> element.
- Move to another stylesheet Allows you to move one or more XSLT global components (templates, functions, or parameters) to another stylesheet. Active only when these entire components are selected. Follow these steps:
 - 1. Choose whether you want to move the selected components to a new stylesheet or an existing one.
 - 2. Select the destination stylesheet. Press the **Choose** button to select the destination stylesheet file. Oxygen XML Developer plugin will automatically check if the destination stylesheet is already contained by the hierarchy of the current stylesheet. If it is not contained, choose whether or not the destination stylesheet will be referenced (imported or included) from the current stylesheet. The following options are available:
 - Include The current stylesheet will use an xsl:include instruction to reference the destination stylesheet.
 - Import The current stylesheet will use an xsl:import instruction to reference the destination stylesheet.
 - None There will be created no relation between the current and destination stylesheets.

- **3.** Press the **Move** button to move the components to the destination stylesheet. The moved components are highlighted in the destination stylesheet.
- **Convert attributes to xsl:attributes** Converts the attributes from the selected element and represents each of them with an <xsl:attribute> instruction. For example, from the following element:

```
<person id="Big{test}Boss"/>
```

you obtain:

• Convert xsl:if into xsl:choose/xsl:when - Converts an xsl:if block to an xsl:when block surrounded by an xsl:choose element. For example, the following block:

```
<xsl:if test="a">
  <!-- XSLT code -->
  </xsl:if>
```

is converted to:

where the | character is the current cursor position.

- Extract local variable Allows you to create a new local variable by extracting the selected XPath expression. After creating the new local variable before the current element, Oxygen XML Developer plugin allows you to edit in-place the variable's name.
 - Note: The action is active on a selection made inside an attribute that contains an XPath expression.
- Extract global variable Allows you to create a new global variable by extracting the selected XPath expression. After creating the new global variable, Oxygen XML Developer plugin allows you to edit in-place the variable's name.
 - Note: The action is active on a selection made inside an attribute that contains an XPath expression.
 - Note: Oxygen XML Developer plugin checks if the selected expression depends on local variables or parameters that are not available in the global context where the new variable is created.
- Extract template parameter Allows you to create a new template parameter by extracting the selected XPath expression. After creating the new parameter, Oxygen XML Developer plugin allows you to edit in-place its name.
 - **Note:** The action is active on a selection made inside an attribute that contains an XPath expression.
- Extract global parameter Allows you to create a new global parameter by extracting the selected XPath expression. After creating the new parameter, Oxygen XML Developer plugin allows you to edit in-place its name.
 - **Note:** The action is active on a selection made inside an attribute that contains an XPath expression.
 - **Note:** Oxygen XML Developer plugin checks if the selected expression depends on local variables or parameters that are not available in the global context where the new parameter is created.

XSLT Resource Hierarchy/Dependencies View

The **Resource Hierarchy/Dependencies** view allows you to see the hierarchy/dependencies for a stylesheet. To open this view, go to **Window** > **Show View** > **Other** > **Oxygen XML Developer plugin** > **Resource Hierarchy/Dependencies**.

If you want to see the hierarchy of a stylesheet, select the desired stylesheet in the project view and choose **Resource Hierarchy** from the contextual menu.

The following actions are available in the **Resource Hierarchy/Dependencies** view:

C Refresh

Refreshes the Hierarchy/Dependencies structure.

Stop

Stops the hierarchy/dependencies computing.

Show Hierarchy

Allows you to choose a resource to compute the hierarchy structure.

Show Dependencies

Allows you to choose a resource to compute the dependencies structure.

Configure

Allows you to configure a scope to compute the dependencies structure. There is also an option for automatically using the defined scope for future operations.

O. History

Provides access to the list of previously computed dependencies. Use the * Clear history button to remove all items from this list.

The contextual menu contains the following actions:

Open

Opens the resource. You can also double-click a resource in the Hierarchy/Dependencies structure to open it.

Copy location

Copies the location of the resource.

Move resource

Moves the selected resource.

Rename resource

Renames the selected resource.

Shows the hierarchy for the selected resource.

Show Resource Dependencies

Shows the dependencies for the selected resource.

Adds the currently selected resource in the Master Files directory.

Expand All

Expands all the children of the selected resource from the Hierarchy/Dependencies structure.

Collapse All

Collapses all children of the selected resource from the Hierarchy/Dependencies structure.

Tip: When a recursive reference is encountered in the Hierarchy view, the reference is marked with a special icon \P .

Moving/Renaming XSLT Resources

You are able to move and rename a resource presented in the **Resource/Hierarchy Dependencies** view, using the **Rename resource** and **Move resource** refactoring actions from the contextual menu.

When you select the **Rename** action in the contextual menu of the **Resource/Hierarchy Dependencies** view, the **Rename resource** dialog box is displayed. The following fields are available:

- New name Presents the current name of the edited resource and allows you to modify it.
- Update references Enable this option to update the references to the resource you are renaming.

When you select the **Move** action from the contextual menu of the **Resource/Hierarchy Dependencies** view, the **Move resource** dialog box is displayed. The following fields are available:

- **Destination** Presents the path to the current location of the resource you want to move and gives you the option to introduce a new location.
- New name Presents the current name of the moved resource and gives you the option to change it.

• **Update references of the moved resource(s)** - Enable this option to update the references to the resource you are moving, in accordance with the new location and name.

If the **Update references of the moved resource(s)** option is enabled, a **Preview** option (which opens the **Preview** dialog box) is available for both actions. The **Preview** dialog box presents a list with the resources that are updated.

XSLT Component Dependencies View

The Component Dependencies view allows you to see the dependencies for a selected XSLT component. You can open the view from Window > Show View > Other > Oxygen XML Developer plugin > Component Dependencies.

If you want to see the dependencies of an XSLT component, select the desired component in the editor and choose the **Component Dependencies** action from the contextual menu. The action is available for all named components (templates, variables, parameters, attribute sets, keys, functions, outputs).

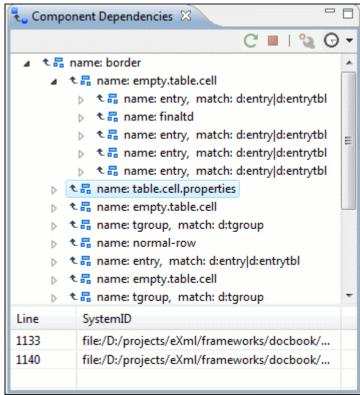

Figure 91: Component Dependencies View - Hierarchy for table.xsl

In the Component Dependencies view you have several actions in the toolbar:

C Refresh

Refreshes the dependencies structure.

Stop

Stops the dependencies computing.

Configure

Allows you to configure a search scope to compute the dependencies structure. You can decide to use automatically the defined scope for future operations by checking the corresponding checkbox.

O. History

Allows you to repeat a previous dependencies computation.

The following actions are available on the contextual menu:

Go to First Reference

Selects the first reference of the referenced component from the current selected component in the dependencies tree.

Go to Component

Shows the definition of the current selected component in the dependencies tree.

Tip: If a component contains multiple references to another, a small table is displayed that contains all references. When a recursive reference is encountered, it is marked with a special icon \mathfrak{P} .

XSLT Quick Assist Support

The **Quick Assist** support helps you to rapidly access search and refactoring actions. If one or more actions are available in the current context, they are accessible via a yellow bulb help marker placed on the cursor line, in the editor line number stripe. Also, you can invoke the **Quick Assist** menu if you press **Ctrl** + **1** keys (**Meta 1** on Mac OS X) on your keyboard.

Two categories of actions are available in the Quick Assist menu:

- Actions available on a selection made inside an attribute that contains an XPath expression:
 - Extract template Extracts the selected XSLT instructions sequence into a new template.
 - Move to another stylesheet Allows you to move one or more XSLT global components (templates, functions, or parameters) to another stylesheet.
 - Extract local variable Allows you to create a new local variable by extracting the selected XPath expression.
 - Extract global variable Allows you to create a new global variable by extracting the selected XPath expression.
 - Extract template parameter Allows you to create a new template parameter by extracting the selected XPath expression.
 - Extract global parameter Allows you to create a new global parameter by extracting the selected XPath expression.

XSLT Quick Fix Support

The Oxygen XML Developer plugin Quick Fix support helps you resolve various errors that appear in a stylesheet by proposing quick fixes to problems such as missing templates, misspelled template names, missing functions, or references to an undeclared variable or parameter.

To activate this feature, hover over or place the cursor in the highlighted area of text where a validation error or warning occurs. If a Quick Fix is available for that particular error or warning, you can access the Quick Fix proposals with any of the following methods:

- When hovering over the error or warning, the proposals are presented in a tooltip popup window.
- If you place the cursor in the highlighted area where a validation error or warning occurs, a quick fix icon () is displayed in the stripe on the left side of the editor. If you click this icon, Oxygen XML Developer plugin displays the list of available fixes.
- With the cursor placed in the highlighted area of the error or warning, you can also invoke the quick fix menu by pressing **Ctrl 1** (**Meta 1 on OS X**) on your keyboard.

Note: The quick fixes are available only when validating an XSLT file with Saxon HE/PE/EE.

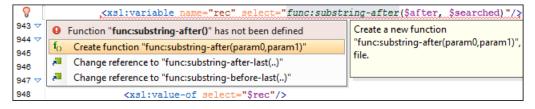

Figure 94: Example of an Undefined XSLT Functions Quick Fix

Figure 95: Example of an Undeclared XSLT Variables/Parameters Quick Fix

Oxygen XML Developer plugin provides XSLT quick fixes for the following types of instances:

- **Template does not exist**, when the template name referenced in a call-template element does not exist. The following fixes are available:
 - **Create template "templateName"** creates a template and generates its corresponding parameters. The template name and parameter names and types are collected from the call-template element.
 - Change reference to "newTemplateName" changes the name of the missing template referenced in the call-template element. The proposed new names are the existing templates with names similar with the missing one.
- Variable/Parameter not declared, when a parameter or variable reference cannot be found. The following fixes are available:
 - **Create global variable "varName"** creates a global variable with the specified name in the current stylesheet. The new variable is added at the beginning of the stylesheet after the last global variable or parameter declaration.
 - Create global parameter "paramName" creates a global parameter with the specified name in the current stylesheet. The new parameter is added at the beginning of the stylesheet after the last global parameter or variable declaration.
 - Create local variable "varName" creates a local variable with the specified name before the current element.
 - Create template parameter "paramName" creates a new parameter with the specified name in the current template. This fix is available if the error is located inside a template.
 - Create function parameter "paramName" creates a new parameter with the specified name in the current function. This fix is available if the error is located inside a function.
 - Change reference to "varName" changes the name of the referenced variable/parameter to an existing local or global variable/parameter, that has a similar name with the current one.
- Parameter from a called template is not declared, when a parameter referenced from a call-template element is not declared. The following fixes are available:
 - Create parameter "paramName" in the template "templateName" creates a new parameter with the specified name in the referenced template.
 - Change "paramName" parameter reference to "newParamName" changes the parameter reference from the call-template element to a parameter that is declared in the called template.
 - Remove parameter "paramName" from call-template removes the parameter with the specified name from the call-template element.
- **No value supplied for required parameter**, when a required parameter from a template is not referenced in a call-template element. The following quick-fix is available::
 - Add parameter "paramName" in call-template creates a new parameter with the specified name in call-template element.
- Function "prefix:functionName()" has not been defined, when a function declaration is not found. The following quick fixes are available:

- Create function "prefix:functionName(param1, param2)" creates a new function with the specified signature, after the current top level element from stylesheet.
- Change function to "newFunctionName(..)" changes the referenced function name to an already defined function. The proposed names are collected from functions with similar names and the same number of parameters.
- Attribute-set "attrSetName" does not exist, when the referenced attribute set does not exist. The following quick
 fixes are available:
 - Create attribute-set "attrSetName" creates a new attribute set with the specified name, after the current top level element from stylesheet.
 - Change reference to "attrSetName" changes the referenced attribute set to an already defined one.
- Character-map "chacterMap" has not been defined, when the referenced character map declaration is not found. The following quick fixes are available:
 - Create character-map "characterMapName" creates a new character map with the specified name, after the
 current top level element from stylesheet.
 - Change reference to "characterMapName" changes the referenced character map to an already defined one.

XSLT Unit Test (XSpec)

XSpec is a behavior driven development (BDD) framework for XSLT and XQuery. XSpec consists of a syntax for describing the behavior of your XSLT or XQuery code, and some code that enables you to test your code against those descriptions.

To create an XSLT Unit Test, go to **File** > **New** > **XSLT Unit Test**. You can also create an XSLT Unit Test from the contextual menu of an XSL file in the **Project** view. Oxygen XML Developer plugin allows you to customize the XSpec document when you create it. In the customization dialog box, you can enter the path to an XSL document or to a master XSL document.

To run an XSLT Unit Test, open the XSPEC file in an editor and click P Apply Transformation Scenario(s) on the main toolbar.

Note: The transformation scenario is defined in the XSPEC *document type*.

When you create an XSpec document based on an XSL document, Oxygen XML Developer plugin uses information from the validation and transformation scenarios associated with the XSL file. From the transformation scenario Oxygen XML Developer plugin uses extensions and properties of Saxon 9.6.0.7, improving the Ant scenario associated with the XSpec document.

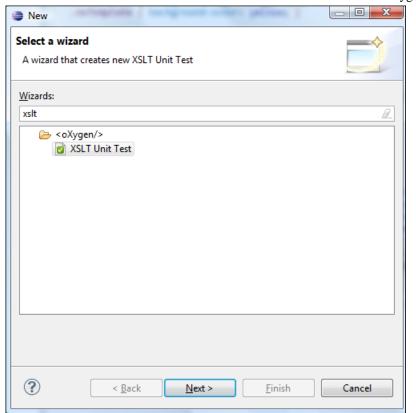

Figure 96: The New XSLT Unit Test Wizard

An XSpec file contains one, or more test scenarios. You can test a stylesheet in one of the following ways:

• Test an entire stylesheet.

Testing is performed in a certain context. You can define a context as follows:

• Inline context, building the test based on a string.

• Based on an external file, or on a part of an external file extracted with an XPath expression.

· Test a function.

```
<x:scenario label="when capitalising a string">
  <x:call function="eg:capital-case">
    <x:param select="'an example string'" />
    <x:param select="true()" />
    </x:call>
    ...
</x:scenario>
```

Test a template with a name.

You are able to reference test files between each other, which allows you to define a suite of tests. For further details about test scenarios, go to https://github.com/expath/xspec/wiki/Writing-Scenarios.

Editing XML Schemas

An XML Schema describes the structure of an XML document and is used to validate XML document instances against it, to check that the XML instances conform to the specified requirements. If an XML instance conforms to the schema then it is said to be valid, otherwise it is invalid.

Two editing modes are provided for working with XML Schema:

- The *Text* editing mode.
- The visual *Design* editing mode.

Note: Oxygen XML Developer plugin offers support for both XML schema 1.0 and 1.1.

Editing XML Schema in Design Editing Mode

This section explains how to use the graphical diagram editing mode for a W3C XML Schema.

Schema Editing Actions

You can edit an XML schema using drag and drop operations or contextual menu actions.

Drag and drop is the easiest way to move the existing components to other locations in an XML schema. For example, you can quickly insert an element reference in the diagram with a drag and drop from the **Outline** view to a compositor in the diagram. Also, the components order in an xs:sequence can be easily changed using drag and drop.

If this property has not been set, you can easily set the attribute/element type by dragging over it a simple type or complex type from the diagram. If the type property for a simple type or complex type is not already set, you can set it by dragging over it a simple or complex type.

Depending on the drop area, different actions are available:

- move Context dependent, the selected component is moved to the destination.
- **reference** Context dependent, the selected component is referenced from the parent.
- copy If (Ctrl (Meta on Mac OS)) key is pressed, a copy of the selected component is inserted to the destination.

Visual clues about the operation type are indicated by the mouse pointer shape:

- 7
 - When moving a component.
- · []
 - When referencing a component.
- When copying a component.

You can edit some schema components directly in the diagram. For these components, you can edit the name and the additional properties presented in the diagram by double clicking the value you want to edit. If you want to edit the name of a selected component, you can also press (Enter). The list of properties which can be displayed for each component can be customized *in the Preferences*.

When editing references, you can choose from a list of available components. Components from an imported schema for which the target namespace does not have an associated prefix is displayed in the list as componentName#targetNamespace. If the reference is from a target namespace which was not yet mapped, you are prompted to add prefix mappings for the inserted component namespace in the current edited schema.

You can also change the compositor by double-clicking it and choose the compositor you want from the proposals list.

There are some components that cannot be edited directly in the diagram: imports, includes, redefines. The editing action can be performed if you double-click or press (Enter) on an import/include/redefine component. An edit dialog box is displayed, allowing you to customize the directives.

Contextual Menu Actions in the Design Mode

The contextual menu of the **Design** mode includes the following actions:

Show Definition (Ctrl Shift Enter)

Shows the definition for the current selected component. For references, this action is available by clicking the arrow displayed in its bottom right corner.

Dpen Schema (Ctrl Shift Enter)

Opens the selected schema. This action is available for xsd:import, xsd:include and xsd:redefine elements. If the file you try to open does not exist, a warning message is displayed and you have the possibility to create the file.

Edit Attributes (Alt + Shift + Enter)

Allows you to edit the attributes of the selected component in a small in-place editor that presents the same attributes as in the Attributes View and the Facets View. The actions that can be performed on attributes in this dialog box are the same actions presented in the two views.

Append child

Offers a list of valid components, depending on the context, and appends your selection as a child of the currently selected component. You can set a name for a named component after it has been added in the diagram.

Insert before

Offers a list of valid components, depending on the context, and inserts your selection before the selected component, as a sibling. You can set a name for a named component after it has been added in the diagram.

Insert after

Offers a list of valid components, depending on the context, and inserts your selection after the selected component, as a sibling. You can set a name for a named component after it has been added in the diagram.

New global

Inserts a global component in the schema diagram. This action does not depend on the current context. If you choose to insert an import you have to specify the URL of the imported file, the target namespace and the import ID. The same information, excluding the target namespace, is requested for an xsd:include or xsd:redefine element.

Note: If the imported file has declared a target namespace, the field **Namespace** is completed automatically.

Edit Schema Namespaces

When performed on the schema root, it allows you to edit the schema target namespace and namespace mappings. You can also invoke the action by double-clicking the target namespace property from **Attributes** view for the schema or by double-clicking the schema component.

Edit Annotations

Allows you to edit the annotation for the selected schema component in the Edit Annotations dialog box. You can perform the following operations in the dialog box:

Edit all appinfo/documentation items for a specific annotation - all appinfo/documentation items for a specific annotation are presented in a table and can be easily edited. Information about an annotation item includes: type (documentation/appinfo), content, source (optional, specify the source of the documentation/appinfoelement) and xml:lang. The content of a documentation/appinfo item can be edited in the **Content** area below the table.

- Insert/Insert before/Remove documentation/appinfo. The Add button allows you to insert a new annotation item (documentation/appinfo). You can add a new item before the item selected in table by pressing the Insert Before button. Also, you can delete the selected item using the × Remove button.
- Move items up/down to do this use the [↑] Move up and [↓] Move down buttons.
- Insert/Insert before/Remove annotation available for components that allow multiple annotations like schemas or redefines.
- Specify an ID for the component annotation. the ID is optional.

Annotations are rendered by default under the graphical representation of the component. When you have a reference to a component with annotations, these annotations are presented in the diagram also below the reference component. The **Edit Annotations** action invoked from the contextual menu edit the annotations for the reference. If the reference component does not have annotations, you can edit the annotations of the referenced component by double-clicking the annotations area. Otherwise you can edit the referenced component annotations only if you go to the definition of the component.

Note: For imported/included components which do not belong to the currently edited schema, the **Edit Annotations** dialog box presents the annotation as read-only. To edit its annotation, open the schema where the component is defined.

Extract Global Element

Action that is available for local elements. A local element is made global and is replaced with a reference to the global element. The local element properties that are also valid for the global element declaration are kept.

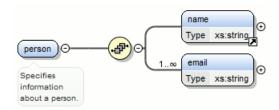

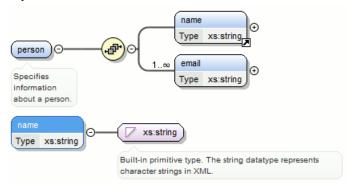

Figure 97: Extracting a Global Element

If you use the Extract Global Element action on a name element, the result is:

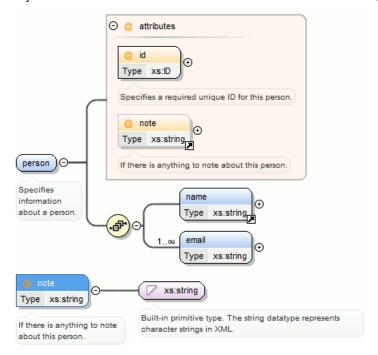

Extract Global Attribute

Action available for local attributes. A local attribute is made global and replaced with a reference to the global attribute. The properties of local attribute that are also valid in the global attribute declaration are kept.

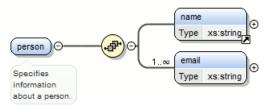

Figure 98: Extracting a Global Attribute

If you use the **Extract Global Attribute** action on a note attribute, the result is:

Extract Global Group

Action available for compositors (sequence, choice, all). This action extracts a global group and makes a reference to it. The action is enabled only if the parent of the compositor is not a group.

If you use the **Extract Global Group** action on the sequence element, the **Extract Global Component** dialog box is displayed and you can choose a name for the group. If you type personGroup, the result is:

Figure 99: Extracting a Global Group

Extract Global Type

Action used to extract an anonymous simple type or an anonymous complex type as global. For anonymous complex types, the action is available on the parent element.

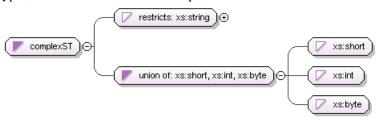

Figure 100: Extracting a Global Simple Type

If you use the action on the union component and choose numericST for the new global simple type name, the result is:

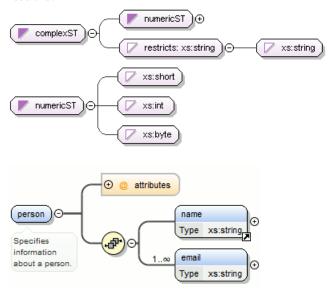

Figure 101: Extracting a Global Complex Type

If you use the action on a person element and choose person_type for the new complex type name, the result is:

EN Rename Component in

Rename the selected component.

Cut Ctrl X (Meta X on OS X)

Cut the selected component(s).

Copy Ctrl C (Meta C on OS X)

Copy the selected component(s).

Copy XPath

This action copies an XPath expression that identifies the selected element or attribute in an instance XML document of the edited schema and places it in the clipboard.

Paste Ctrl V (Meta V on OS X)

Paste the component(s) from the clipboard as children of the selected component.

Paste as Reference

Create references to the copied component(s). If not possible a warning message is displayed.

Remove (Delete)

Remove the selected component(s).

Override component

Copies the overridden component in the current XML Schema. This option is available for xs:override components.

Redefine component

The referenced component is added in the current XML Schema. This option is available for xs:redefine components.

Optional

Can be performed on element/attribute/group references, local attributes, elements, compositors, and element wildcards. The minOccurs property is set to 0 and the use property for attributes is set to optional.

Unbounded

Can be performed on element/attribute/group references, local attributes, elements, compositors, and element wildcards. The maxOccurs property is set to unbounded and the use property for attributes is set to required.

Search

Can be performed on local elements or attributes. This action makes a reference to a global element or attribute.

Search References

Searches all references of the item found at current cursor position in the defined scope if any.

Search References in

Searches all references of the item found at current cursor position in the specified scope.

Search Occurrences in File

Searches all occurrences of the item found at current cursor position in the current file.

Component Dependencies

Allows you to see the dependencies for the current selected component.

Resource Hierarchy

Allows you to see the hierarchy for the current selected resource.

Flatten Schema

Recursively adds the components of included Schema files to the main one. It also flattens every imported XML Schema from the hierarchy.

Resource Dependencies

Allows you to see the dependencies for the current selected resource.

Expand All

Recursively expands all sub-components of the selected component.

Collapse All

Recursively collapses all sub-components of the selected component.

Save as Image

Save the diagram as image, in JPEG, BMP, SVG or PNG format.

Generate Sample XML Files

Generate XML files using the current opened schema. The selected component is the XML document root. See more in the *Generate Sample XML Files* section.

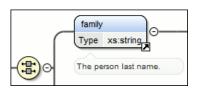

○Options

Show the Schema preferences panel.

XML Schema Components

A schema diagram contains a series of interconnected components. To quickly identify the relation between two connected components, the connection is represented as:

• A thick line to identify a connection with a required component (in the following image, family is a required element).

• A thin line to identify a connection with an optional component (in the following image, email is an optional element).

The following topics explain in detail all available components and their symbols as they appear in an XML schema diagram.

xs:schema

Defines the root element of a schema. A schema document contains representations for a collection of schema components, such as type definitions and element declarations, that have a common target namespace. See more info at http://www.w3.org/TR/xmlschema11-1/#element-schema.

By default, it displays the *targetNamespace* property when rendered.

xs:schema properties

Property Name	Description	Possible Values
Target Namespace	The schema target namespace.	Any URI
Element Form Default	Determining whether local element declarations will be namespace-qualified by default.	qualified, unqualified, [Empty]. Default value is unqualified.
Attribute Form Default	Determining whether local attribute declarations will be namespace-qualified by default.	qualified, unqualified, [Empty]. Default value is unqualified.
Block Default	Default value of the block attribute of xs:element and xs:complexType.	#all, extension, restriction, substitution, restriction extension, restriction substitution, extension substitution, restriction extension substitution, [Empty].
Final Default	Default value of the final attribute of xs:element and xs:complexType.	#all, restriction, extension, restriction extension, [Empty].
Default Attributes	Specifies a set of attributes that apply to every complex Type in a schema document.	Any.
Xpath Default Namespace	The default namespace used when the XPath expression is evaluated.	##defaultNamespace, ##targetNamespace, ##local.
Version	Schema version	Any token.
ID	The schema id	Any ID.
Component	The edited component name.	Not editable property.
SystemID	The schema system id	Not editable property.

xs:element

Defines an element. An element declaration is an association of a name with a type definition, either simple or complex, an (optional) default value and a (possibly empty) set of identity-constraint definitions. See more info at http://www.w3.org/TR/xmlschema11-1/#element-element.

An element by default displays the following properties when rendered in the diagram: *default*, *fixed*, *abstract* and *type*. When referenced or declared locally, the element graphical representation also contains the value for the *minOccurs* and *maxOccurs* properties (for 0..1 and 1..1 occurs the values are implied by the connector style) and the connectors to the element are drawn using dotted lines if the element is optional.

Property Name	Description	Possible Values	Mentions
Name	The element name. Always required.	Any NCName for global or local elements, any QName for element references.	If missing, will be displayed as '[element]' in diagram.
Is Reference	When set, the local element is a reference to a global element.	true/false	Appears only for local elements.
Туре	The element type.	All declared or built-in types. In addition, the following anonymous types are available: [ST-restriction], [ST-union], [ST-list], [CT-anonymous], [CT-extension SC], [CT-restriction SC], [CT-restriction CC], [CT-extension CC].	For all elements. For references, the value is set in the referenced element.
Base Type	The extended/restricted base type.	All declared or built-in types	For elements with complex type, with simple or complex content.
Mixed	Defines if the complex type content model will be mixed.	true/false	For elements with complex type.
Content	The content of the complex type.	simple/complex	For elements with complex type which extends/restricts a base type. It is automatically detected.
Content Mixed	Defines if the complex content model will be mixed.	true/false	For elements with complex type which has a complex content.
Default	Default value of the element. A default value is automatically assigned to the element when no other value is specified.	Any string	The fixed and default attributes are mutually exclusive.
Fixed	A simple content element may be fixed to a specific value using this attribute. A fixed value is also automatically assigned to the element and you cannot specify another value.	Any string	The fixed and default attributes are mutually exclusive.
Min Occurs	Minimum number of occurrences of the element.	A numeric positive value. Default value is 1	Only for references/local elements
Max Occurs	Maximum number of occurrences of the element.	A numeric positive value. Default value is 1	Only for references/local elements

Property Name	Description	Possible Values	Mentions
Substitution Group	Qualified name of the head of the substitution group to which this element belongs.	All declared elements. For XML Schema 1.1 this property supports multiple values.	For global and reference elements
Abstract	Controls whether the element may be used directly in instance XML documents. When set to true, the element may still be used to define content models, but it must be substituted through a substitution group in the instance document.	true/false	For global elements and element references
Form	Defines if the element is "qualified" (i.e. belongs to the target namespace) or "unqualified" (i.e. doesn't belong to any namespace).	unqualified/qualified	Only for local elements
Nillable	When this attribute is set to true, the element can be declared as nil using an xsi:nil attribute in the instance documents.	true/false	For global elements and element references
Target Namespace	Specifies the target namespace for local element and attribute declarations. The namespace URI may be different from the schema target namespace. This property is available for local elements only.	Not editable property.	For all elements.
Block	Controls whether the element can be subject to a type or substitution group substitution. '#all' blocks any substitution, 'substitution' blocks any substitution through substitution groups and 'extension'/'restriction' block any substitution (both through xsi:type and substitution groups) by elements or types, derived respectively by extension or restriction from the type of the element. Its default value is defined by the blockDefault attribute of the parent xs:schema.	#all, restriction, extension, substitution, extension restriction, extension substitution, restriction substitution, restriction extension substitution	For global elements and element references

manta	1	202

Property Name	Description	Possible Values	Mentions
Final	Controls whether the element can be used as the head of a substitution group for elements whose types are derived by extension or restriction from the type of the element. Its default value is defined by the finalDefault attribute of the parent xs:schema.	#all, restriction, extension, restriction extension, [Empty]	For global elements and element references
ID	The component id.	Any id	For all elements.
Component	The edited component name.	Not editable property.	For all elements.
Namespace	The component namespace.	Not editable property.	For all elements.
System ID	The component system id.	Not editable property.	For all elements.

xs:attribute

Defines an attribute. See more info at http://www.w3.org/TR/xmlschema11-1/#element-attribute.

An attribute by default displays the following properties when rendered in the diagram: default, fixed, use and type. Connectors to the attribute are drawn using dotted lines if the attribute use is optional. The attribute name is stroked out if prohibited.

xs:attribute properties

Property Name	Description	Possible Value	Mentions
Name	Attribute name. Always required.	Any NCName for global/local attributes, all declared attributes' QName for references.	For all local or global attributes. If missing, will be displayed as '[attribute]' in the diagram.
Is Reference	When set, the local attribute is a reference.	true/false	For local attributes.
Туре	Qualified name of a simple type.	All global simple types and built-in simple types. In addition another 3 proposals are present: [anonymous restriction], [anonymous list], [anonymous union] for creating anonymous simple types more easily.	references, the type is set to
Default	Default value. When specified, an attribute is added by the schema processor (if it is missing from the instance XML document) and it is given this value. The default and	Any string	For all local or global attributes. For references the value is from the referenced attribute.

Property Name	Description	Possible Value	Mentions Deca
	fixed attributes are mutually exclusive.		
Fixed	When specified, the value of the attribute is fixed and must be equal to this value. The default and fixed attributes are mutually exclusive.	Any string	For all local or global attributes. For references the value is from the referenced attribute.
Use	Possible usage of the attribute. Marking an attribute "prohibited" is useful to exclude attributes during derivations by restriction.	optional, required, prohibited	For local attributes
Form	Specifies if the attribute is qualified (i.e. must have a namespace prefix in the instance XML document) or not. The default value for this attribute is specified by the attributeFormDefault attribute of the xs:schema document element.	unqualified/qualified	For local attributes.
Inheritable	Specifies if the attribute is inheritable. Inheritable attributes can be used by <alternative> element on descendant elements.</alternative>	true/false	For all local or global attributes. The default value is false. This property is available for XML Schema 1.1.
Target Namespace	Specifies the target namespace for local attribute declarations. The namespace URI may be different from the schema target namespace.	Any URI	Setting a target namespace for local attribute is useful only when restricts attributes of a complex type that is declared in other schema with different target namespace. This property is available for XML Schema 1.1.
ID	The component id.	Any id	For all attributes.
Component	The edited component name.	Not editable property.	For all attributes.
Namespace	The component namespace.	Not editable property.	For all attributes.
System ID	The component system id.	Not editable property.	For all attributes.

xs:attributeGroup

Defines an attribute group to be used in complex type definitions. See more info at http://www.w3.org/TR/xmlschema11-1/#element-attributeGroup.

xs:attributeGroup properties

Property Name	Description	Possible Values	Mentions
Name	Attribute group name. Always required.	Any NCName for global attribute groups, all declared attribute groups for reference.	For all global or referenced attribute groups. If missing, will be displayed as '[attributeGroup]' in diagram.
ID	The component id.	Any id	For all attribute groups.
Component	The edited component name.	Not editable property.	For all attribute groups.
Namespace	The component namespace.	Not editable property.	For all attribute groups.
System ID	The component system id.	Not editable property.	For all attribute groups.

xs:complexType

Defines a top level complex type. Complex Type Definitions provide for: See more data at http://www.w3.org/TR/xmlschema11-1/#element-complexType.

- Constraining element information items by providing Attribute Declarations governing the appearance and content
 of attributes.
- Constraining element information item children to be empty, or to conform to a specified element-only or mixed
 content model, or else constraining the character information item children to conform to a specified simple type
 definition.
- Using the mechanisms of Type Definition Hierarchy to derive a complex type from another simple or complex type.
- Specifying post-schema-validation infoset contributions for elements.
- Limiting the ability to derive additional types from a given complex type.
- Controlling the permission to substitute, in an instance, elements of a derived type for elements declared in a content model to be of a given complex type.
- **Tip:** A complex type which is a base type to another type will be rendered with yellow background.

xs:complexType properties

Property Name	Description	Possible Values	Mentions
Name	The name of the complex type. Always required.	Any NCName	Only for global complex types. If missing, will be displayed as '[complexType]' in diagram.
Base Type Definition	The name of the extended/restricted types.	Any from the declared simple or complex types.	For complex types with simple or complex content.
Derivation Method	The derivation method.	restriction/ extension	Only when base type is set. If the base type is a simple type, the derivation method is always extension.
Content	The content of the complex type.	simple/ complex	For complex types which extend/restrict a base type. It is automatically detected.
Content Mixed	Specifies if the complex content model will be mixed.	true/false	For complex contents.
Mixed	Specifies if the complex type content model will be mixed.	true/false	For global and anonymous complex types.

Property Name	Description	Possible Values	Mentions
Abstract	When set to true, this complex type cannot be used directly in the instance documents and needs to be substituted using an xsi:type attribute.	true/false	For global and anonymous complex types.
Block	Controls whether a substitution (either through a xsi:type or substitution groups) can be performed for a complex type, which is an extension or a restriction of the current complex type. This attribute can only block such substitutions (it cannot "unblock" them), which can also be blocked in the element definition. The default value is defined by the blockDefault attribute of xs:schema.	all, extension, restriction, extension restriction, [Empty]	For global complex types.
Final	Controls whether the complex type can be further derived by extension or restriction to create new complex types.	all, extension, restriction, extension restriction, [Empty]	For global complex types.
Default Attributes Apply	The schema element can carry a defaultAttributes attribute, which identifies an attribute group. Each complexType defined in the schema document then automatically includes that attribute group, unless this is overridden by the defaultAttributesApply attribute on the complexType element.	true/false	This property is available only for XML Schema 1.1.
ID	The component id.	Any id	For all complex types.
Component	The edited component name.	Not editable property.	For all complex types.
Namespace	The component namespace.	Not editable property.	For all complex types.
System ID	The component system id.	Not editable property.	For all complex types.

xs:simpleType

Defines a simple type. A simple type definition is a set of constraints on strings and information about the values they encode, applicable to the normalized value of an attribute information item or of an element information item with no

element children. Informally, it applies to the values of attributes and the text-only content of elements. See more info at http://www.w3.org/TR/xmlschema11-1/#element-simpleType.

xs:alternative

The type alternatives mechanism allows you to specify type substitutions on an element declaration.

Note: xs:alternative is available for XML Schema 1.1.

Test @type='html'

xs:alternative properties

Name	Description	Possible Values
Туре	Specifies type substitutions for an element, depending on the value of the attributes.	All declared or built-in types. In addition, the following anonymous types are available: [ST-restriction], [ST-union], [ST-list], [CT-anonymous], [CT-extension SC], [CT-restriction SC], [CT-restriction CC], [CT-extension CC].
Test	Specifies an XPath expression. If the XPath condition is valid, the specified type is selected as the element type. The expressions allowed are limited to a subset of XPath 2.0. Only the attributes of the current element and inheritable attributes from ancestor elements are accessible in the XPath expression. When you edit this property, the content completion list of proposals offers XPath expressions.	An XPath expression.
XPath Default Namespace	The default namespace used when the XPath expression is evaluated.	##defaultNamespace, ##targetNamespace, ##local.
ID	Specifies the component ID.	Any ID.
Component	Specifies the type of XML schema component.	Not editable property.

Name	Description	Possible Values
System ID	Points to the document location of the schema.	Not editable property.

xs:group

Defines a group of elements to be used in complex type definitions. See more info at http://www.w3.org/TR/xmlschema11-1/#element-group.

When referenced, the graphical representation also contains the value for the *minOccurs* and *maxOccurs* properties (for 0..1 and 1..1 occurs the values are implied by the connector style) and the connectors to the group are drawn using dotted lines if the group is optional.

xs:group properties

Property Name	Description	Possible Values	Mentions
Name	The group name. Always required.	Any NCName for global groups, all declared groups for reference.	If missing, will be displayed as '[group]' in diagram.
Min Occurs	Minimum number of occurrences of the group.	A numeric positive value. Default value is 1.	Appears only for reference groups.
Max Occurs	Maximum number of occurrences of the group.	A numeric positive value. Default value is 1.	Appears only for reference groups.
ID	The component id.	Any id	For all groups.
Component	The edited component name.	Not editable property.	For all groups.
Namespace	The component namespace.	Not editable property	For all groups.
System ID	The component system id.	Not editable property.	For all groups.

xs:include

Adds multiple schemas with the same target namespace to a document. See more info at http://www.w3.org/TR/xmlschema11-1/#element-include.

xs:include properties

Property Name	Description	Possible Values
Schema Location	Included schema location.	Any URI
ID	Include ID.	Any ID
Component	The component name.	Not editable property.

xs:import

Adds multiple schemas with different target namespace to a document. See more info at http://www.w3.org/TR/xmlschema11-1/#element-import.

xs:import properties

Property Name	Description	Possible Values
Schema Location	Imported schema location	Any URI
Namespace	Imported schema namespace	Any URI
ID	Import ID	Any ID
Component	The component name	Not editable property.

xs:redefine

Redefines simple and complex types, groups, and attribute groups from an external schema. See more info at http://www.w3.org/TR/xmlschema11-1/#element-redefine.

xs:redefine properties

Property Name	Description	Possible Values
Schema Location	Redefine schema location.	Any URI
ID	Redefine ID	Any ID
Component	The component name.	Not editable property.

xs:override

The override construct allows replacements of old components with new ones without any constraint. See more info at http://www.w3.org/TR/xmlschema11-1/#element-override.

xs:override properties

Property Name	Description	Possible Values
Schema Location	Redefine schema location.	Any URI
ID	Redefine ID	Any ID

xs:notation

Describes the format of non-XML data within an XML document. See more info at http://www.w3.org/TR/xmlschema11-1/#element-notation.

xs:notation properties

Property Name	Description	Possible values	Mentions
Name	The notation name. Always required.	Any NCName.	If missing, will be displayed as '[notation]' in diagram.
System Identifier	The notation system identifier.	Any URI	Required if public identifier is absent, otherwise optional.
Public Identifier	The notation public identifier.	A Public ID value	Required if system identifier is absent, otherwise optional.
ID	The component id.	Any ID	For all notations.
Component	The edited component name.	Not editable property.	For all notations.

Property Name	Description	Possible values	Mentions
Namespace	The component namespace.	Not editable property.	For all notations.
System ID	The component system id.	Not editable property.	For all notations.

xs:sequence, xs:choice, xs:all

Figure 102: An xs: sequence in diagram

xs: sequence specifies that the child elements must appear in a sequence. Each child element can occur from 0 to any number of times. See more info at http://www.w3.org/TR/xmlschema11-1/#element-sequence.

Figure 103: An xs:choice in diagram

xs: choice allows only one of the elements contained in the declaration to be present within the containing element. See more info at http://www.w3.org/TR/xmlschema11-1/#element-choice.

Figure 104: An xs:all in diagram

xs:all specifies that the child elements can appear in any order. See more info at http://www.w3.org/TR/xmlschema11-1/#element-all.

The compositor graphical representation also contains the value for the minOccurs and maxOccurs properties (for 0..1 and 1..1 occurs the values are implied by the connector style) and the connectors to the compositor are drawn using dotted lines if the compositor is optional.

xs:sequence, xs:choice, xs:all properties

Property Name	Description	Possible Values	Mentions
Compositor	Compositor type.	sequence, choice, all.	'all' is only available as a child of a group or complex type.
Min Occurs	Minimum occurrences of compositor.	A numeric positive value. Default is 1.	The property is not present if compositor is 'all' and is child of a group.
Max Occurs	Maximum occurrences of compositor.	A numeric positive value. Default is 1.	The property is not present if compositor is 'all' and is child of a group.
ID	The component id.	Any ID	For all compositors.
Component	The edited component name.	Not editable property.	For all compositors.
System ID	The component system id.	Not editable property.	For all compositors.

xs:any

Enables the author to extend the XML document with elements not specified by the schema. See more info at http://www.w3.org/TR/xmlschema11-1/#element-any.

The graphical representation also contains the value for the minOccurs and maxOccurs properties (for 0..1 and 1..1 occurs the values are implied by the connector style) and the connectors to the wildcard are drawn using dotted lines if the wildcard is optional.

xs:any properties

Property Name	Description	Possible Values
Namespace	The list of allowed namespaces. The namespace attribute expects a list of namespace URIs. In this list, two values have a specific meaning: '##targetNamespace' stands for the target namespace, and '##local' stands for local attributes (without namespaces).	##any, ##other, ##targetNamespace, ##local or anyURI
notNamespace	Specifies the namespace that extension elements or attributes cannot come from.	##local, ##targetNamespace
notQName	Specifies an element or attribute that is not allowed.	##defined
Process Contents	Type of validation required on the elements allowed for this wildcard.	skip, lax, strict
Min Occurs	Minimum occurrences of any	A numeric positive value. Default is 1.
Max Occurs	Maximum occurrences of any	A numeric positive value. Default is 1.
ID	The component id.	Any ID.
Component	The name of the edited component.	Not editable property.
System ID	The component system id.	Not editable property.

xs:anyAttribute

Enables the author to extend the XML document with attributes not specified by the schema. See more info at http://www.w3.org/TR/xmlschema11-1/#element-anyAttribute.

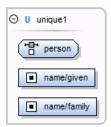

xs:anyAttribute properties

Property Name	Description	Possible Value
Namespace	The list of allowed namespaces. The namespace attribute expects a list of namespace URIs. In this list, two values have a specific meaning: '##targetNamespace' stands for the target namespace, and '##local' stands for local attributes (without namespaces).	##any, ##other, ##targetNamespace, ##local or anyURI
Process Contents	Type of validation required on the elements allowed for this wildcard.	skip, lax, strict
ID	The component id.	Any ID.

		- 1	^	4	1	

Property Name	Description	Possible Value
Component	The name of the edited component.	Not editable property.
System ID	The component system id.	Not editable property.

xs:unique

Defines that an element or an attribute value must be unique within the scope. See more info at http://www.w3.org/TR/xmlschema11-1/#element-unique.

xs:unique properties

Property Name	Description	Possible Values
Name	The unique name. Always required.	Any NCName.
ID	The component id.	Any ID.
Component	The edited component name.	Not editable property.
Namespace	The component namespace.	Not editable property.
System ID	The component system id.	Not editable property.

xs:key

Specifies an attribute or element value as a key (unique, non-nullable and always present) within the containing element in an instance document. See more info at http://www.w3.org/TR/xmlschema11-1/#element-key.

xs:key properties

Property Name	Description	Possible Value
Name	The key name. Always required.	Any NCName.
ID	The component id.	Any ID.
Component	The edited component name.	Not editable property.
Namespace	The component namespace.	Not editable property.
System ID	The component system id.	Not editable property.

xs:keyRef

Specifies that an attribute or element value corresponds to that of the specified key or unique element. See more info at http://www.w3.org/TR/xmlschema11-1/#element-keyref.

A keyref by default displays the *Referenced Key* property when rendered.

xs:keyRef properties

Property Name	Description	Possible Values
Name	The keyref name. Always required.	Any NCName.
Referenced Key	The name of referenced key.	any declared element constraints.
ID	The component id.	Any ID.
Component	The edited component name.	Not editable property.
Namespace	The component namespace.	Not editable property.
System ID	The component system id.	Not editable property.

xs:selector

Specifies an XPath expression that selects a set of elements for an identity constraint. See more info at http://www.w3.org/TR/xmlschema11-1/#element-selector.

xs:selector properties

Property Name	Description	Possible Values
XPath	Relative XPath expression identifying the element on which the constraint applies.	An XPath expression.
ID	The component id.	Any ID.
Component	The edited component name.	Not editable property.
System ID	The component system id.	Not editable property.

xs:field

Specifies an XPath expression that specifies the value used to define an identity constraint. See more info at http://www.w3.org/TR/xmlschema11-1/#element-field.

xs:field properties

Property Name	Description	Possible Values
XPath	Relative XPath expression identifying the field(s) composing the key, key reference, or unique constraint.	An XPath expression.

Property Name	Description	Possible Values
ID	The component id.	Any ID.
Component	The edited component name.	Not editable property.
System ID	The component system id.	Not editable property.

xs:assert

Assertions provide a flexible way to control the occurrence and values of elements and attributes available in an XML Schema.

Note: xs:assert is available for XML Schema 1.1.

xs:assert properties

Property Name	Description	Possible Values
Test	Specifies an XPath expression. If the XPath condition is valid, the specified type is selected as the element type. The expressions allowed are limited to a subset of XPath 2.0. Only the attributes of the current element and inheritable attributes from ancestor elements are accessible in the XPath expression. When you edit this property, the content completion list of proposals offers XPath expressions.	An XPath expression.
XPath Default Namespace	The default namespace used when the XPath expression is evaluated.	##defaultNamespace, ##targetNamespace, ##local.
ID	Specifies the component ID.	Any ID.
Component	The edited component name.	Not editable property.
System ID	The component system id.	Not editable property.

xs:openContent

The openContent element enables instance documents to contain extension elements interleaved among the elements declared by the schema. You can declare open content for your elements at one place - within the complexType definition, or at the schema level.

For further details about the openContent component, go to http://www.w3.org/TR/xmlschema11-1/#element-openContent.

xs:openContent properties

Property Name	Description	Possible Value
Mode	Specifies where the extension elements can be inserted.	The value can be: "interleave", "suffix" or "none". The default value is "interleave".
ID	The component id.	Any ID.
Component	The edited component name.	Not editable property.

Property Name	Description	Possible Value
System ID	The component system id.	Not editable property.

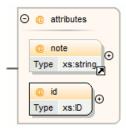

Note: This component is available for XML Schema 1.1 only. To change the version of the XML Schema, *open the Preferences dialog box* and go to XML > XML Parser > XML Schema.

Constructs Used to Group Schema Components

This section explains the components that can be used for grouping other schema components:

- Attributes
- Constraints
- Substitutions

Attributes

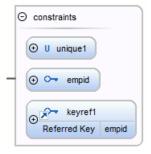

Groups all attributes and attribute groups belonging to a complex type.

Attributes properties

Property Name	Description	Possible Values
Component	The element for which the attributes are displayed.	Not editable property.
System ID	The component system id.	Not editable property.

Constraints

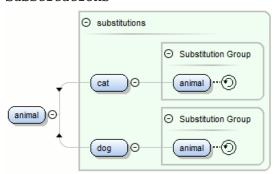

Groups all constraints (xs:key, xs:keyRef or xs:unique) belonging to an element.

Attributes properties

Property Name	Description	Possible Values
Component	The element for which the constraints are displayed.	Not editable property.
System ID	The component system id.	Not editable property.

Substitutions

Groups all elements which can substitute the current element.

Attributes properties

Property Name	Description	Possible Values
Component	The element for which the substitutions are displayed.	Not editable property.
System ID	The component system id.	Not editable property.

Schema Validation

Validation for the **Design** mode is seamlessly integrated in the Oxygen XML Developer plugin *XML documents validation* capability.

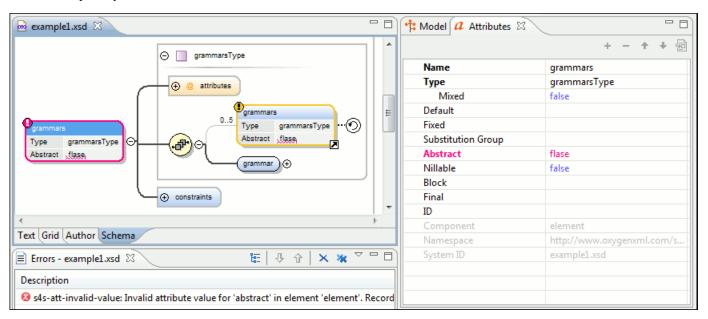

Figure 105: XML Schema Validation

A schema validation error is presented by highlighting the invalid component:

- In the *Attributes View*.
- In the diagram by surrounding the component that has the error with a red border.

Invalid facets for a component are highlighted in the Facets View.

Components with invalid properties are rendered with a red border. This is a default color, but you can customize it in the *Document checking user preferences*. When hovering an invalid component, the tooltip will present the validation errors associated with that component.

When editing a value which is supposed to be a qualified or unqualified XML name, the application provides automatic validation of the entered value. This proves to be very useful in avoiding setting invalid XML names for the given property.

If you validate the entire schema using the Validate action from the XML menu or from the Validation toolbar drop-down menu, all validation errors will be presented in the Errors tab. To resolve an error, just click it (or double-click for errors located in other schemas) and the corresponding schema component will be displayed as the diagram root so that you can easily correct the error.

Tip: If the validation action finds that the schema contains unresolved references, the application will suggest the use of validation scenarios, but only if the current edited schema is a XML Schema module.

Edit Schema Namespaces

You can use the **XML Schema Namespaces** dialog box to easily set a target namespace and define namespace mappings for a newly created XML Schema. In the **Design** mode these namespaces can be modified anytime by choosing **Edit Schema Namespaces** from the contextual menu. Also you can do that by double-clicking the schema root in the diagram.

The XML Schema Namespaces dialog box allows you to edit the following information:

- Target namespace The target namespace of the schema.
- **Prefixes** The dialog box displays a table with namespaces and the mapped prefixes. You can add a new prefix mapping or remove an already existing one.

Editing XML Schema in Text Editing Mode

This page is used for editing the XML Schema in a text mode. It offers powerful content completion support, a synchronized Outline view, and multiple *refactoring actions*. The Outline view has two display modes: the *standard outline* mode and the *components* mode.

A diagram of the XML Schema can be presented side by side with the text. To activate the diagram presentation, enable the *Show Full Model XML Schema diagram* check box from the *Diagram* preferences page.

Content Completion in XML Schema

The intelligent **Content Completion Assistant** available in Oxygen XML Developer plugin enables rapid, in-line identification and insertion of elements, attributes and attribute values valid in the editing context. All available proposals are listed in a pop-up menu displayed at the current cursor position.

The **Content Completion Assistant** is enabled by default. To disable it, *open the Preferences dialog box* and go to *Editor > Content Completion*. It is activated:

- Automatically, after a configurable delay from the last key press of the < character. You can adjust the delay from the Content Completion preferences page.
- On demand, by pressing **Ctrl Space** (**Command Space on OS X**) on a partial element or attribute name.
 - Note: If the Content Completion list contains only one valid proposal, when you press the <u>Ctrl Space</u> (<u>Command Space on OS X</u>) shortcut key, the proposal is automatically inserted.

When active, it displays a list of context-sensitive proposals valid at the current cursor position. Elements are selected in the list using the Up and Down cursor keys on your keyboard. For each selected item in the list, the **Content Completion Assistant** displays a documentation window. You can customize the size of the documentation window by dragging its top, right, and bottom borders.

To insert the selected content, do one of the following:

- Press Enter or Tab key on your keyboard to insert both the start and end tags. The cursor is positioned inside the start tag, in a position suitable for inserting attributes.
- Press <u>Ctrl Enter (Meta Enter on OS X)</u> on your keyboard. Oxygen XML Developer plugin inserts both the start and end tags and positions the cursor between the tags, so you can start typing content.

Depending on the *selected schema version*, Oxygen XML Developer plugin populates the proposals list with information taken either from XML Schema 1.0 or 1.1.

Oxygen XML Developer plugin helps you to easily reference a component by providing the list of proposals (complex types, simple types, elements, attributes, groups, attribute groups, or notations) valid in the current context. The components are collected from the current file or from the imported/included schemas.

When editing xs:annotation/xs:appinfo elements of an XML Schema, the Content Completion Assistant proposes elements and attributes from a custom schema (by default ISO Schematron). This feature can be configured from the XSD Content Completion preferences page.

Highlight Component Occurrences

When a component (for example types, elements, attributes) is found at current cursor position, Oxygen XML Developer plugin performs a search over the entire document to find the component declaration and all its references. When found, they are highlighted both in the document and in the stripe bar, at the right side of the document. Customizable colors are used: one for the component definition and another one for component references. Occurrences are displayed until another component is selected and a new search is performed. All occurrences are removed when you start to edit the document.

This feature is on by default. To configured it, *open the Preferences dialog box* and go to **Editor** > **Mark Occurrences**. A search can also be triggered with the **Search** > **Search Occurrences in File** () contextual menu action. All matches are displayed in a separate tab of the **Results** view.

Editing XML Schema in the Master Files Context

Smaller interrelated modules that define a complex XML Schema cannot be correctly edited or validated individually, due to their interdependency with other modules. For example, an element defined in a main schema document is not visible when you edit an included module. Oxygen XML Developer plugin provides the support for defining the main module (or modules), thus allowing you to edit any of the imported/included schema files in the context of the larger schema structure.

You cat set a main XML document either using the *master files support from the Navigator view*, or using a validation scenario.

To set a main file using a validation scenario, add validation units that point to the main schemas. Oxygen XML Developer plugin warns you if the current module is not part of the dependencies graph computed for the main schema. In this case, it considers the current module as the main schema.

The advantages of editing in the context of main file include:

- Correct validation of a module in the context of a larger schema structure.
- **Content Completion Assistant** displays all the referable components valid in the current context. This include components defined in modules other than the currently edited one.
- The **Outline** displays the components collected from the entire schema structure.

Searching and Refactoring Actions in XML Schemas

Search Actions

The following search actions can be applied on attribute, attributeGroup, element, group, key, unique, keyref, notation, simple, or complex types and are available from the **Search** submenu in the contextual menu of the current editor:

- Search References Searches all references of the item found at current cursor position in the defined scope, if any. If a scope is defined, but the current edited resource is not part of the range of resources determined by this, a warning dialog box is displayed and you have the possibility to define another search scope.
- **Search References in** Searches all references of the item found at current cursor position in the file or files that you specify when define a scope in the **Search References** dialog box.
- Search Declarations Searches all declarations of the item found at current cursor position in the defined scope if any. If a scope is defined, but the current edited resource is not part of the range of resources determined by this, a warning dialog box will be displayed and you have the possibility to define another search scope.
- **Search Declarations in** Searches all declarations of the item found at current cursor position in the file or files that you specify when you define a scope for the search operation.
- Search Occurrences in File Searches all occurrences of the item at the cursor position in the currently edited file.

The following action is available from the **XSL** menu:

- Show Definition Moves the cursor to the definition of the referenced XML Schema item.
 - Note: You can also use the <u>Ctrl Single-Click (Command Single-Click on OS X)</u> shortcut on a reference to display its definition.

Refactoring Actions

The following refactoring actions can be applied on attribute, attributeGroup, element, group, key, unique, keyref, notation, simple, or complex types and are available from the **Refactoring** submenu in the contextual menu of the current editor:

- Rename Component Allows you to rename the current component in-place. The component and all its references
 in the document are highlighted with a thin border and the changes you make to the component at the cursor position
 are updated in real time to all occurrences of the component. To exit in-place editing, press the <u>Esc</u> or <u>Enter</u> key on
 your keyboard.
- Rename Component in Opens the Rename *component_type* dialog box that allows you to rename the selected component by specifying the new component name and the files to be affected by the modification. If you click the **Preview** button, you can view the files affected by the **Rename Component** action.

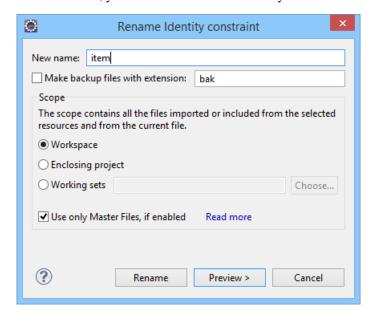

Figure 106: Rename Identity Constraint Dialog Box

XML Schema Outline View

The **Outline** view for XML Schema presents all the global components grouped by their location, namespace, or type. If hidden, you can open it from **Window** > **Show View** > **Outline**.

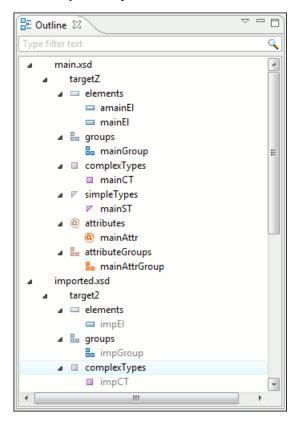

Figure 107: The Outline View for XML Schema

The **Outline** view provides the following options in the **View Menu** on the **Outline** view action bar:

Filter returns exact matches

The text filter of the **Outline** view returns only exact matches;

Selection update on cursor move

Allows a synchronization between **Outline** view and schema diagram. The selected view from the diagram is also selected in the **Outline** view.

♣ Sort

Allows you to sort alphabetically the schema components.

Show all components

Displays all components that were collected starting from the main files. Components that are not referable from the current file are marked with an orange underline. To reference them, add an import directive with the componentNS namespace.

Show referable components

Displays all components (collected starting from the main files) that can be referenced from the current file. This option is set by default.

Show only local components

Displays the components defined in the current file only.

Group by location/namespace/type

These three operations allow you to group the components by location, namespace, or type. When grouping by namespace, the main schema target namespace is the first presented in the **Outline** view.

The following contextual menu actions are available in the **Outline** view:

Remove (Delete)

Removes the selected item from the diagram.

Search References

Searches all references of the item found at current cursor position in the defined scope, if any.

Search References in

Searches all references of the item found at current cursor position in the specified scope.

Component Dependencies

Allows you to see the dependencies for the current selected component.

Resource Hierarchy

Allows you to see the hierarchy for the current selected resource.

Resource Dependencies

Allows you to see the dependencies for the current selected resource.

EN Rename Component in

Renames the selected component.

Generate Sample XML Files

Generate XML files using the current opened schema. The selected component is the XML document root.

The upper part of the **Outline** view contains a filter box that allows you to focus on the relevant components. Type a text fragment in the filter box and only the components that match it are presented. For advanced usage you can use wildcard characters (*, ?) and separate multiple patterns with commas.

Tip: The search filter is case insensitive. The following wildcards are accepted:

- * any string
- ? any character
- , patterns separator

If no wildcards are specified, the string to search will be searched as a partial match (like *textToFind*).

The content of the **Outline** view and the editing area are synchronized. When you select a component in the **Outline** view, its definition is highlighted in the editing area.

Component Dependencies View for XML Schema

The Component Dependencies view allows you to spot the dependencies for the selected component of an XML Schema, a *Relax NG schema*, a *NVDL schema* or an *XSLT stylesheet*. You can open the view from **Window** > **Show** View > Other > Oxygen XML Developer plugin > Component Dependencies.

If you want to see the dependencies of a schema component:

- Select the desired schema component in the editor.
- Choose the **Component Dependencies** action from the contextual menu.

The action is available for all named components (for example elements or attributes).

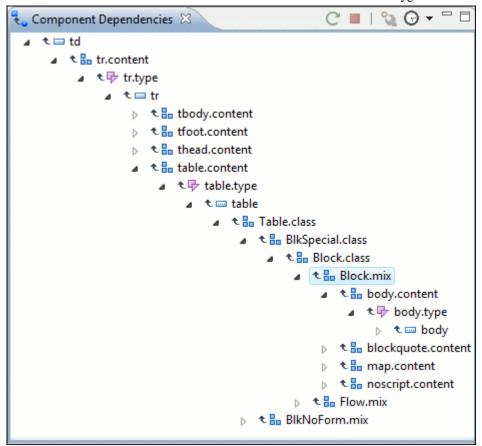

Figure 108: Component Dependencies View - Hierarchy for xhtml11.xsd

In the **Component Dependencies** view the following actions are available in the toolbar:

C Refresh

Refreshes the dependencies structure.

Stop

Stop the dependencies computing.

Configure

Allows you to configure a search scope to compute the dependencies structure.

G. History

Contains a list of previously executed dependencies computations.

The contextual menu contains the following actions:

Go to First Reference

Selects the first reference of the referenced component from the current selected component in the dependencies tree.

Go to Component

Shows the definition of the currently selected component in the dependencies tree.

Tip: If a component contains multiple references to another components, a small table is displayed that contains all these references. When a recursive reference is encountered, it is marked with a special icon §.

XML Schema Quick Assist Support

The *Quick Assist* support improves the development work flow, offering fast access to the most commonly used actions when you edit XML Schema documents.

The *Quick Assist* feature is activated automatically when the cursor is positioned over the name of a component. It is accessible via a yellow bulb help marker placed on the cursor line, in the line number stripe on the left side of the editor. Also, you can invoke the quick assist menu by using the **Ctrl** + 1 keys (**Meta 1** on Mac OS X) keyboard shortcuts.

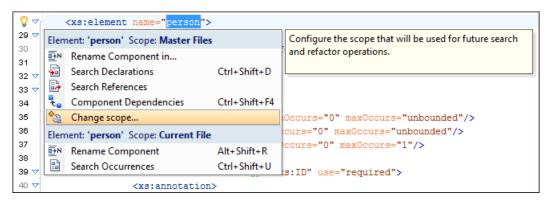

Figure 109: Quick Assist Support

The quick assist support offers direct access to the following actions:

EN Rename Component in

Renames the component and all its dependencies.

Search Declarations

Searches the declaration of the component in a predefined scope. It is available only when the context represents a component name reference.

Search References

Searches all references of the component in a predefined scope.

Component Dependencies

Searches the component dependencies in a predefined scope.

Change Scope

Configures the scope that will be used for future search or refactor operations.

EN Rename Component

Allows you to rename the current component in-place.

Search Occurrences

Searches all occurrences of the component within the current file.

To watch our video demonstration about improving schema development using the **Quick Assist** action set, go to http://oxygenxml.com/demo/Quick_Assist.html.

XML Schema Resource Hierarchy / Dependencies View

The **Resource Hierarchy / Dependencies** view allows you to easily see the hierarchy / dependencies for an XML Schema, a *Relax NG schema* or an *XSLT stylesheet*. To open this view, go to **Window > Show View > Other > Oxygen XML Developer plugin > Resource Hierarchy/Dependencies**.

The **Resource Hierarchy / Dependencies** is useful when you want to start from an XML Schema (XSD) file and build and review the hierarchy of all the other XSD files that are imported, included or redefined in the given XSD file. The view is also able to build the tree structure, that is the structure of all other XSD files that import, include or redefine the given XSD file. The scope of the search is configurable (the current project, a set of local folders, etc.)

The build process for the hierarchy view is started with the **Resource Hierarchy** action available on the contextual menu of the editor panel.

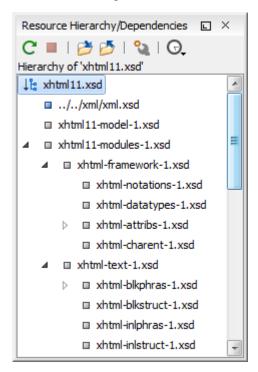

Figure 110: Resource Hierarchy/Dependencies View - Hierarchy for xhtml11.xsd

The build process for the dependencies view is started with the **Resource Dependencies** action available on the contextual menu.

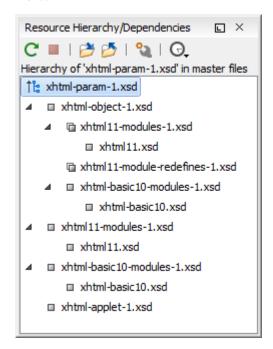

Figure 111: Resource Hierarchy/Dependencies View - Dependencies for xhtml-param-1.xsd

The following actions are available in the **Resource Hierarchy/Dependencies** view:

Refreshes the Hierarchy/Dependencies structure.

Stop

Stops the hierarchy/dependencies computing.

Show Hierarchy

Allows you to choose a resource to compute the hierarchy structure.

Show Dependencies

Allows you to choose a resource to compute the dependencies structure.

Configure

Allows you to configure a scope to compute the dependencies structure. There is also an option for automatically using the defined scope for future operations.

O. History

Provides access to the list of previously computed dependencies. Use the ** Clear history button to remove all items from this list.

The contextual menu contains the following actions:

Open

Opens the resource. You can also double-click a resource in the Hierarchy/Dependencies structure to open it.

Copy location

Copies the location of the resource.

Move resource

Moves the selected resource.

Rename resource

Renames the selected resource.

Show Resource Hierarchy

Shows the hierarchy for the selected resource.

Show Resource Dependencies

Shows the dependencies for the selected resource.

Adds the currently selected resource in the Master Files directory.

Expand All

Expands all the children of the selected resource from the Hierarchy/Dependencies structure.

Collapse All

Collapses all children of the selected resource from the Hierarchy/Dependencies structure.

Moving/Renaming XML Schema Resources

You are able to move and rename a resource presented in the **Resource/Hierarchy Dependencies** view, using the **Rename resource** and **Move resource** refactoring actions from the contextual menu.

When you select the **Rename** action in the contextual menu of the **Resource/Hierarchy Dependencies** view, the **Rename resource** dialog box is displayed. The following fields are available:

- New name Presents the current name of the edited resource and allows you to modify it.
- **Update references** Enable this option to update the references to the resource you are renaming.

When you select the **Move** action from the contextual menu of the **Resource/Hierarchy Dependencies** view, the **Move resource** dialog box is displayed. The following fields are available:

- **Destination** Presents the path to the current location of the resource you want to move and gives you the option to introduce a new location.
- New name Presents the current name of the moved resource and gives you the option to change it.
- **Update references of the moved resource(s)** Enable this option to update the references to the resource you are moving, in accordance with the new location and name.

If the **Update references of the moved resource(s)** option is enabled, a **Preview** option (which opens the **Preview** dialog box) is available for both actions. The **Preview** dialog box presents a list with the resources that are updated.

Generate Sample XML Files

Oxygen XML Developer plugin offers support to generate sample XML files both from XML schema 1.0 and XML schema 1.1, depending on the XML schema version set in **Preferences**.

To generate sample XML files from an XML Schema, use the Generate Sample XML Files action from the XML Tools menu. This action is also available in the contextual menu of the schema *Design mode*.

The Generate Sample XML Files dialog box contains the following tabs:

- Schema
- Options
- Advanced

To watch our video demonstration about generating sample XML files, go to http://oxygenxml.com/demo/Generate_Sample_XML_Files.html.

The Schema Tab

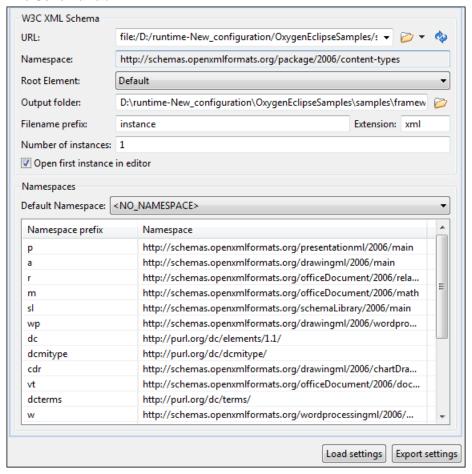

Figure 112: The Generate Sample XML Files Dialog Box

Complete the dialog box as follows:

- URL Schema location as an URL. A history of the last used URLs is available in the drop-down box.
- Namespace Displays the namespace of the selected schema.
- **Document root** After the schema is selected, this drop-down box is populated with all root candidates gathered from the schema. Choose the root of the output XML documents.
- Output folder Path to the folder where the generated XML instances will be saved.
- **Filename prefix and Extension** Generated file names have the following format: prefixN.extension, where N represents an incremental number from 0 up to *Number of instances 1*.
- Number of instances The number of XML files to be generated.
- Open first instance in editor When checked, the first generated XML file is opened in editor.
- Namespaces Here you can specify the default namespace as well as the proxies (prefixes) for namespaces.
- Load settings / Export settings The current settings can be saved for further usage with the Export settings button, and reloaded when necessary with the Load settings button.

The Options Tab

The **Options** tab allows you to set specific options for different namespaces and elements.

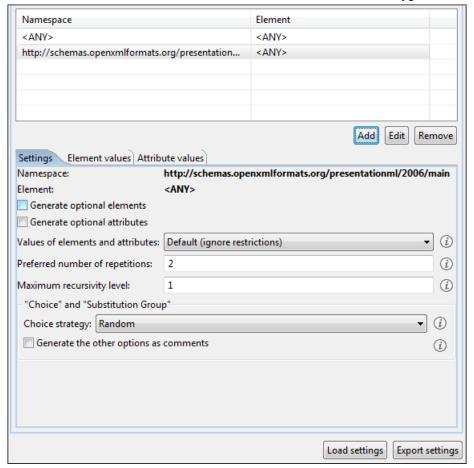

Figure 113: The Generate Sample XML Files Dialog Box

- Namespace / Element table Allows you to set a namespace for each element name that appears in an XML document instance. The following prefix-to-namespace associations are available:
 - All elements from all namespaces (<ANY> <ANY>). This is the default setting and can be customized from the *XML Instances Generator* preferences page.
 - All elements from a specific namespace.
 - A specific element from a specific namespace.

Settings

- **Generate optional elements** When checked, all elements are generated, including the optional ones (having the minoccurs attribute set to 0 in the schema).
- **Generate optional attributes** When checked, all attributes are generated, including the optional ones (having the use attribute set to optional in the schema.)
- Values of elements and attributes Controls the content of generated attribute and element values. Several choices are available:
 - None No content is inserted.
 - **Default** Inserts a default value depending of data type descriptor of the particular element or attribute. The default value can be either the data type name or an incremental name of the attribute or element (according to the global option from the **XML Instances Generator** preferences page). Note that type restrictions are ignored when this option is enabled. For example, if an element is of a type that restricts an **xs:string** with the **xs:maxLength** facet in order to allow strings with a maximum length of 3, the XML instance generator tool may generate string element values longer than 3 characters.
 - Random Inserts a random value depending of data type descriptor of the particular element or attribute.

Important:

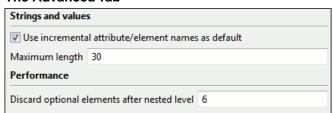

If all of the following are true, the XML Instances Generator outputs invalid values:

- At least one of the restrictions is a regexp.
- The value generated after applying the regexp does not match the restrictions imposed by one of the facets.

This limitation leads to attributes or elements with values set to *Invalid*.

- **Preferred number of repetitions** Allows you to set the preferred number of repeating elements related with minOccurs and maxOccurs facets defined in XML Schema.
 - If the value set here is between minOccurs and maxOccurs, then that value is used.
 - If the value set here is less than minOccurs, then the minOccurs value is used.
 - If the value set here is greater than maxOccurs, then maxOccurs is used.
- Maximum recursion level If a recursion is found, this option controls the maximum allowed depth of the same element.
- Choice strategy Option used for xs: choice or substitutionGroup elements. The possible strategies are:
 - First The first branch of xs:choice or the head element of substitutionGroup is always used.
 - **Random** A random branch of xs:choice or a substitute element or the head element of a substitutionGroup is used.
- Generate the other options as comments Option to generate the other possible choices or substitutions (for xs:choice and substitutionGroup). These alternatives are generated inside comments groups so you can uncomment and use them later. Use this option with care (for example on a restricted namespace and element) as it may generate large result files.
- Load settings / Export settings The current settings can be saved for further usage with the Export settings button, and reloaded when necessary with the Load settings button.
- **Element values** The **Element values** tab allows you to add values that are used to generate the elements content. If there are more than one value, then the values are used in a random order.
- Attribute values The Attribute values tab allows you to add values that are used to generate the attributes content. If there are more than one value, then the values are used in a random order.

The Advanced Tab

This tab allows you to set advanced options that controls the output values of elements and attributes.

- Use incremental attribute / element names as default If checked, the value of an element or attribute starts with the name of that element or attribute. For example, for an a element the generated values are: a1, a2, a3, and so on. If not checked, the value is the name of the type of that element / attribute (for example: string, decimal, etc.)
- Maximum length The maximum length of string values generated for elements and attributes.
- **Discard optional elements after nested level** The optional elements that exceed the specified nested level are discarded. This option is useful for limiting deeply nested element definitions that can quickly result in very large XML documents.

Generating Documentation for an XML Schema

Oxygen XML Developer plugin can generate detailed documentation for the components of an XML Schema in HTML, PDF, DocBook, or other custom formats. You can select the components and the level of detail. The components are hyperlinked in both HTML and DocBook documents.

Note: You can generate documentation for both XML Schema version 1.0 and 1.1.

To generate documentation for an XML Schema document, select **XML Schema Documentation** from the **XML Tools** > **Generate Documentation** menu or from the **Generate XML Schema Documentation** action from the contextual menu of the **Navigator** view.

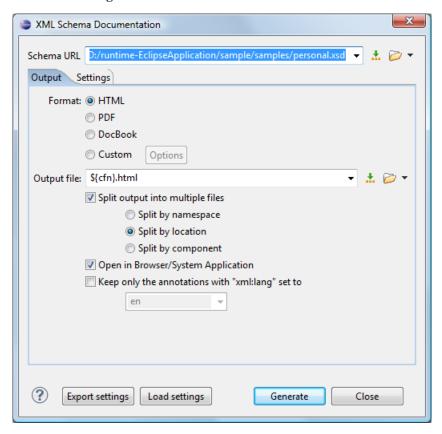

Figure 114: The XML Schema Documentation Dialog Box

The **Schema URL** field of the dialog box must contain the full path to the XML Schema (XSD) file for which you want to generate documentation. The schema may be a local or a remote file. You can specify the path to the schema by entering it in the text field, or by using the **Insert Editor Variables** button or the options in the **Browse** drop-down menu.

The Output Tab

The following options are available in the **Output** tab:

- Format Allows you to choose between the following formats:
 - **HTML** The documentation is generated in *HTML output format*.
 - **PDF** The documentation is generated in *PDF output format*.
 - **DocBook** The documentation is generated in *DocBook output format*.
 - **Custom** The documentation is generated in a *custom output format*, allowing you to control the output. Click the **Options** button to open a **Custom format options** dialog box where you can specify a custom stylesheet for creating the output. There is also an option to **Copy additional resources to the output folder** and you can

select the path to the additional **Resources** that you want to copy. You can also choose to keep the intermediate XML files created during the documentation process by deselecting the **Delete intermediate XML file** option.

- Output file You can specify the path of the output file by entering it in the text field, or by using the ... Insert Editor Variables button or the options in the ... Browse drop-down menu.
- **Split output into multiple files** Instructs the application to split the output into multiple files. You can choose to split them by namespace, location, or component name.
- Open in Browser/System Application Opens the result in the system application associated with the output file type.
 - Note: To set the browser or system application that will be used, *open the Preferences dialog box*, then go to General > Web Browser. This will take precedence over the default system application settings.
- **Keep only the annotations with xml:lang set to** The generated output will contain only the annotations with the xml:lang attribute set to the selected language. If you choose a primary language code (for example, **en** for English), this includes all its possible variations (**en-us**, **en-uk**, etc.).

The Settings Tab

When you generate documentation for an XML schema you can choose what components to include in the output and the details to be included in the documentation.

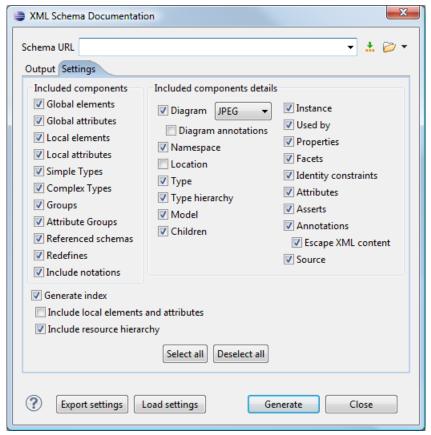

Figure 115: The Settings Tab of the XML Schema Documentation Dialog Box

The **Settings** tab allows you to choose whether or not to include the following components: **Global elements**, **Global attributes**, **Local elements**, **Local attributes**, **Simple Types**, **Complex Types**, **Groups**, **Attribute Groups**, **Redefines**, **Referenced schemas**, **Include notations**.

You can choose whether or not to include the following other details:

- **Diagram** Displays the diagram for each component. You can choose the image format (JPEG, PNG, SVG) to use for the diagram section. The generated diagrams are dependent on the options from the *Schema Design Properties* page.
 - **Diagram annotations** This option controls whether the annotations of the components presented in the diagram sections are included.
- Namespace Displays the namespace for each component.
- Location Displays the schema location for each component.
- **Type** Displays the component type if it is not an anonymous one.
- **Type hierarchy** Displays the types hierarchy.
- **Model** Displays the model (sequence, choice, all) presented in BNF form. Different separator characters are used depending on the information item used:
 - xs:all its children will be separated by space characters.
 - xs: sequence its children will be separated by comma characters.
 - xs:choice its children will be separated by / characters.
- **Children** Displays the list of component's children.
- Instance Displays an XML instance generated based on each schema element.
- Used by Displays the list of all the components that reference the current one. The list is sorted by component type and name.
- **Properties** Displays some of the component's properties.
- Facets Displays the facets for each simple type
- **Identity constraints** Displays the identity constraints for each element. For each constraint there are presented the name, type (unique, key, keyref), reference attribute, selector and field(s).
- **Attributes** Displays the attributes for the component. For each attribute there are presented the name, type, fixed or default value, usage and annotation.
- **Asserts** Displays the **assert** elements defined in a complex type. The test, XPath default namespace, and annotation are presented for each assert.
- Annotations Displays the annotations for the component. If you choose Escape XML Content, the XML tags are
 present in the annotations.
- **Source** Displays the text schema source for each component.
- Generate index Displays an index with the components included in the documentation.
 - **Include local elements and attributes** If checked, local elements and attributes are included in the documentation index.
 - **Include resource hierarchy** Specifies whether the resource hierarchy for an XML Schema documentation is generated.

Export settings - Save the current settings in a settings file for further use (for example, with the exported settings file you can generate the same *documentation from the command line interface*.)

Load settings - Reloads the settings from the exported file.

Generate - Use this button to generate the XML Schema documentation.

Output Formats for Generating XML Schema Documentation

XML Schema documentation can be generated in HTML, PDF, DocBook, or a custom format. You can choose the format from the *Schema Documentation* dialog box. For the PDF and DocBook formats, the option to split the output in multiple files is not available.

HTML Output Format

The XML Schema documentation generated in HTML format contains images corresponding to the same schema definitions as the ones displayed by *the schema diagram editor*. These images are divided in clickable areas that are linked to the definitions of the names of types or elements. The documentation of a definition includes a **Used By** section

with links to the other definitions that reference it. If the **Escape XML Content** option is unchecked, the HTML or XHTML tags used inside the xs:documentation elements of the input XML Schema for formatting the documentation text (for example <b, <i>, <u>, <u>, , , etc.) are rendered in the generated HTML documentation.

The generated images format is **PNG**. The image of an XML Schema component contains the graphical representation of that component as it is rendered in *the Schema Diagram panel of the Oxygen XML Developer plugin XSD editor panel*.

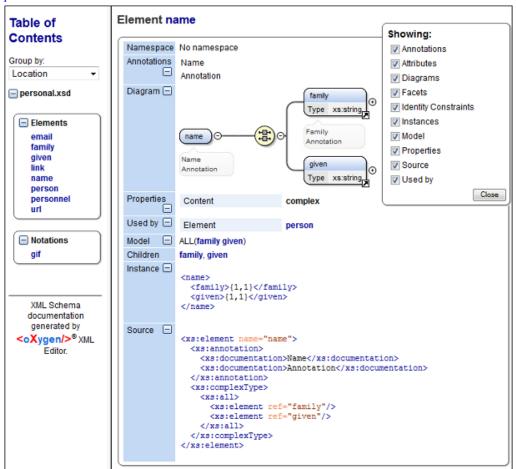

Figure 116: XML Schema Documentation Example

The generated documentation includes a table of contents. You can group the contents by namespace, location, or component type. After the table of contents there is some information about the main, imported, included, and redefined schemas. This information contains the schema target namespace, schema properties (attribute form default, element form default, version), and schema location.

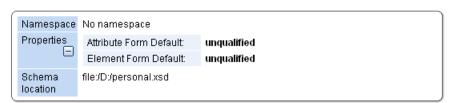

Figure 117: Information About a Schema

If you choose to split the output into multiple files, the table of contents is displayed in the left frame. The contents are grouped in the same mode. If you split the output by location, each file contains a schema description and the components that you have chosen to include. If you split the output by namespace, each file contains information about schemas from that namespace and the list with all included components. If you choose to split the output by component, each file contains information about a schema component.

After the documentation is generated, you can collapse or expand details for some schema components by using the **Showing** options or the \Box **Collapse** or \Box **Expand** buttons.

Figure 118: The Showing Options

For each component included in the documentation, the section presents the component type follow by the component name. For local elements and attributes, the name of the component is specified as *parent name/component name*. You can easily go to the parent documentation by clicking the parent name.

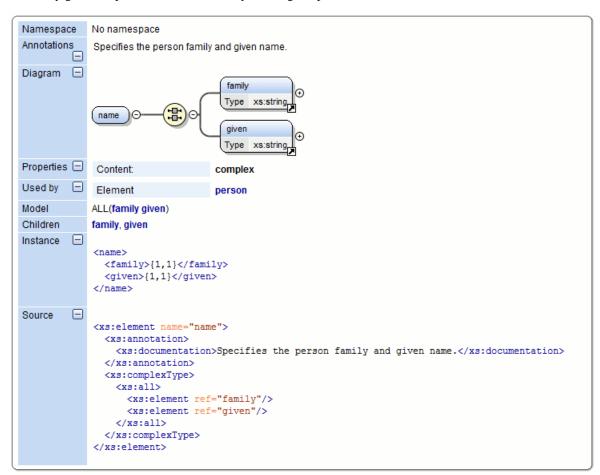

Figure 119: Documentation for a Schema Component

If the schema contains imported or included modules, their dependencies tree is generated in the documentation.

PDF Output Format

For the PDF output format, the documentation is generated in DocBook format and a transformation using the FOP processor is applied to obtain the PDF file. To configure the FOP processor, see the *FO Processors* preferences page.

For information about customizing the PDF output, see the *Customizing the PDF Output of Generated XML Schema Documentation* on page 236 topic.

DocBook Output Format

If you generate the documentation in DocBook output format, the documentation is generated as a DocBook XML file. You can then apply a predefined transformation scenario (such as, *DocBook PDF* or *DocBook HTML*) on the output file, or configure your own transformation scenario for it to convert it into whatever format you desire.

Custom Output Format

For the custom format, you can specify a stylesheet to transform the intermediary XML file generated in the documentation process. You have to edit your stylesheet based on the schema xsdDocSchema.xsd from [OXYGEN_DIR]/frameworks/schema_documentation. You can create a custom format starting from one of the stylesheets used in the predefined HTML, PDF, and DocBook formats. These stylesheets are available in [OXYGEN_DIR]/frameworks/schema_documentation/xsl.

When using a custom format you can also copy additional resources into the output folder and choose to keep the intermediate XML files created during the documentation process.

Customizing the PDF Output of Generated XML Schema Documentation

To customize the PDF output of the generated XML Schema documentation, use the following procedure:

1. Customize the [OXYGEN_DIR]/frameworks/schema_documentation/xsl/xsdDocDocbook.xsl stylesheet to include the content that you want to add in the PDF output. Add the content in the XSLT template with the match="schemaDoc" attribute between the info and xsl:apply-templates elements, as commented in the following example:

Note: The content that you insert here has to be wrapped in DocBook markup. For details about working with DocBook see the following video demonstration: http://www.oxygenxml.com/demo/DocBook_Editing_in_Author.html.

- 2. Create an intermediary file that holds the content of your XML Schema documentation.
 - a. Go to Tools > Generate Documentation > XML Schema Documentation.
 - **b.** Select **Custom** for the output format and click the **Options** button.
 - c. In the Custom format options dialog box, do the following:
 - a. Enter the customized stylesheet in the Custom XSL field ([OXYGEN_DIR]/frameworks/schema_documentation/xsl/xsdDocDocbook.xsl).
 - b. Enable the Copy additional resources to the output folder option, and leave the default selection in the Resources field.
 - c. Click OK.
 - **d.** When you return to the **XML Schema Documentation** dialog box, just press the **Generate** button to generate a DocBook XML file with an intermediary form of the Schema documentation.
- **3.** Create the final PDF document.
 - a. Use the Configure Transformation Scenario(s) action from the toolbar or the XML menu, click New, and select XML transformation with XSLT.
 - **b.** In the **New Scenario** dialog box, go to the **XSL URL** field and choose the [OXYGEN_DIR]/frameworks/docbook/oxygen/xsdDocDocbookCustomizationFO.xsl file.
 - c. Go to the FO Processor tab and enable the Perform FO Processing and XSLT result as input options.
 - **d.** Go to the **Output** tab and select the directory where you want to store the XML Schema documentation output and click **OK**.
 - e. Click Apply Associated.

Generating XML Schema Documentation From the Command-Line Interface

You can export the settings of the *XML Schema Documentation dialog box* to an XML file by pressing the **Export settings** button. With the exported configuration file, you can generate the same documentation from the command-line interface by running the following script:

- schemaDocumentation.bat on Windows.
- schemaDocumentation.sh on OS X / Unix / Linux.

The script is located in the Oxygen XML Developer plugin installation folder. The script can be integrated in an external batch process launched from the command-line interface. The script accepts a variety command line arguments that allow you to configure the documentation.

The accepted syntax and arguments are as follows:

```
schemaDocumentation schemaFile [ [-cfg:configFile] | [ [-out:outputFile]
[-format:<value>] [-xsl:<xslFile>] [-split:<value>] [-openInBrowser:<value>] ] |
--help | -help | --h | -h ]
```

schemaFile

The XML Schema file.

-cfg:configfile

The exported configuration file. It contains the output file, output format options, split method, and some advanced options regarding the included components and components details. If an external configuration file is specified, all other supplied arguments except for the XML Schema file will be ignored.

-out:outputFile

The file where the generated documentation will be saved. By default, it is the name of the schema file with an *html* extension.

-format:<value>

The output format type used when generating the documentation. Possible values are as follows:

• html - To generate documentation in HTML format.

- pdf To generate documentation in PDF format.
- docbook To generate documentation in DocBook format.
- custom To generate documentation in a custom format.

-xsl:<xslFile>

The XSL file to be applied on the intermediate XML format. If there is no XSL file provided, the result will be in the HTML format.

-split:<value>

The split method used when generating the documentation. Splitting is recommended for large schemas. Possible values are as follows:

- none (default value) To generate one single output file.
- namespace To generate an output file for every namespace in the schema.
- component To generate an output file for every component in the schema.
- location To generate an output file for every schema location.

-openInBrowser:<value>

Opens the result of the transformation in a browser or system application. Possible values are true or false (default value).

--help | -help | --h | -h

Displays the available options.

Example of the script in a Windows command line:

schemaDocumentation example.xsd -out:schemaDocumentation.html -format:custom -xsl:example.xsl
-split:namespace

Convert Database Structure to XML Schema

Oxygen XML Developer plugin includes a tool that allows you to create an XML Schema from the structure of a database. To convert a database structure to an XML Schema, use the following procedure:

- 1. Select the Convert DB Structure to XML Schema action from the Tools menu.
 - The **Convert DB Structure to XML Schema** dialog box is opened and your current database connections are displayed in the **Connections** section.
- 2. If the database source is not listed, click the **Configure Database Sources** button to open the **Data Sources** preferences page where you can configure data sources and connections.
- **3.** In the **Format for generated schema** section, select one of the following formats:
 - Flat schema A flat structure that resembles a tree-like view of the database without references to elements.
 - **Hierarchical schema** Display the table dependencies visually, in a type of tree view where dependent tables are shown as indented child elements in the content model. Select this option if you want to configure the database columns of the tables to be converted.

4. Click Connect

The database structure is listed in the **Select database tables** section according to the format you chose.

- **5.** Select the database tables that you want to be included in the XML Schema.
- **6.** If you selected **Hierarchical schema** for the format, you can configure the database columns.
 - a) Select the database column you want to configure.
 - b) In the **Criterion** section you can choose to convert the selected database column as an **Element**, **Attribute**, or to be **Skipped** in the resulting XML Schema.
 - c) You can also change the name of the selected database column by changing it in the Name text field.

7. Click Generate XML Schema.

The database structure is converted to an XML Schema and it is opened for viewing and editing.

Flatten an XML Schema

You can organize an XML schema on several levels linked by xs:include and xs:import statements. In some cases, working on such a schema as on a single file is more convenient.

The **Flatten Schema** operation allows you to flatten an entire hierarchy of XML schemas. Starting with the main XML schema, Oxygen XML Developer plugin calculates its hierarchy by processing the xs:include and xs:import statements. This action is available from the contextual menu of the editor.

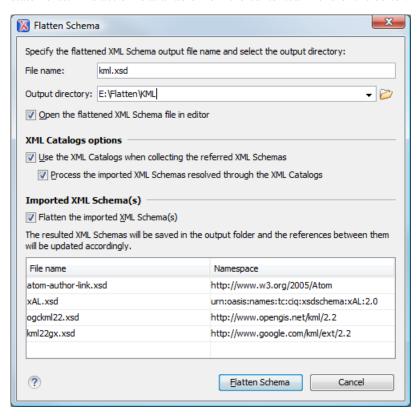

Figure 120: Flatten Schema Dialog Box

For the main schema file and for each imported schema, a new flattened schema is generated in the output folder. These schemas have the same name as the original ones.

Note: If necessary, the operation renames the resulted schemas to avoid duplicated file names.

Note: You can choose the output folder and the name of each generated schema file.

A flattened XML schema is obtained by recursively adding the components of the included schemas into the main one. This means Oxygen XML Developer plugin replaces the xs:include, xs:redefine, and xs:override elements with the ones coming from the included files.

The following options are available in the **Flatten Schema** dialog box:

- Open the flattened XML Schema file in editor opens the main flattened schema in the editing area after the operation completes
- Use the XML Catalogs when collecting the referenced XML Schemas enables resolving the imported and included schemas through the available XML Catalogs;
 - Note: Changing this option triggers the recalculation of the dependencies graph for the main schema.
- Process the imported XML Schemas resolved through the XML Catalogs specifies whether the imported schemas that were resolved through an XML Catalog are flattened
- Flatten the imported XML Schema(s) specifies whether the imported schemas are flattened.

Note: For the schemas skipped by the flatten operation, no files are created in the output folder and the corresponding import statements remain unchanged.

To flatten a schema from the command line, use the following command:

- flattenSchema.bat on Windows
- sh flattenSchemaMac.sh on OS X
- sh flattenSchema.sh on Unix/Linux

The command line accepts the following parameters:

- -in:inputSchemaURL the input schema URL
- -outDir:outputDirectory the directory where the flattened schemas should be saved
- -flattenImports: <boolean_value> controls if the imported XML Schemas should be flattened or not. The default value true
- -useCatalogs: <boolean_value> controls if the references to other XML Schemas should be resolved through the available XML Catalogs. The default value false
- -flattenCatalogResolvedImports:<boolean_value> controls if the imported schemas that were resolved through the XML Catalogs should be flattened or not
 - Note: This option is used only when -useCatalogs is set to true. The default value is true.
- verbose provides information about the current flatten XML Schema operation
- --help | -help | --h | -h prints the available parameters for the operation

Command Line Example for Windows

flattenSchema.bat -in:http://www.w3.org/MarkUp/SCHEMA/xhtml11.xsd -outDir:mySchemas/flattened/xhtml -flattenImports:true -useCatalogs:true -flattenCatalogResolvedImports:true -verbose

Command Line Example for OS X

sh flattenSchemaMac.sh -in:http://www.w3.org/MarkUp/SCHEMA/xhtml11.xsd -outDir:mySchemas/flattened/xhtml -flattenImports:true -useCatalogs:true -flattenCatalogResolvedImports:true -verbose

Command Line Example for Unix/Linux

sh flattenSchema.sh -in:http://www.w3.org/MarkUp/SCHEMA/xhtml11.xsd -outDir:mySchemas/flattened/xhtml -flattenImports:true -useCatalogs:true -flattenCatalogResolvedImports:true -verbose

XML Schema Regular Expressions Builder

The XML Schema regular expressions builder allows testing regular expressions on a fragment of text as they are applied to an XML instance document. Start the tool from the **XML Tools** menu.

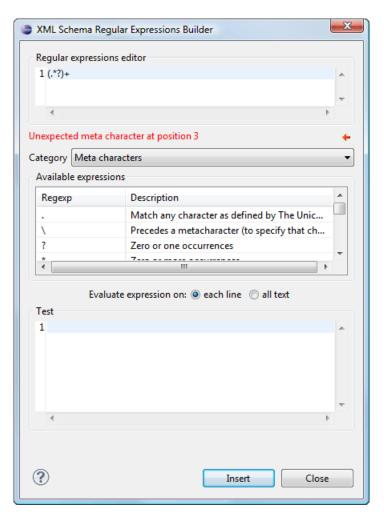

Figure 121: XML Schema Regular Expressions Builder Dialog Box

The dialog box contains the following sections:

- Regular expressions editor allows you to edit the regular expression to be tested and used. Content completion
 is available and presents a list with all the predefined expressions. It is triggered by pressing <u>Ctrl Space (Command Space on OS X)</u>.
- Error display area if the edited regular expression is incorrect, an error message will be displayed here. The message contains the description and the exact location of the error. Also, clicking the quick navigation button () highlights the error inside the regular expression.
- Category combo box here you can choose from several categories of predefined expressions. The selected category influences the displayed expressions in the **Available expressions** table.
- Available expressions table holds the available regular expressions and a short description for each of them. The set of expressions depends on the category selected in the previous combo box. You can add an expression in the **Regular expressions editor** by double-clicking the expression row in the table. You will notice that in the case of **Character categories** and **Block names** the expressions are also listed in complementary format. For example: \p\{Lu\} Uppercase letters; \P\{Lu\} Complement of: Uppercase letters.
- Evaluate expression on radio buttons there are available two options:
 - Evaluate expression on each line the edited expression will be applied on each line in the **Test** area.
 - Evaluate expression on all text the edited expression will be applied on the whole text.
- **Test** area a text editor which allows you to enter a text sample on which the regular expression will be applied. All matches of the edited regular expression will be highlighted.

After editing and testing your regular expression you can insert it in the current editor. The **Insert** button will become active when an editor is opened in the background and there is an expression in the **Regular expressions editor**.

The regular expression builder cannot be used to insert regular expressions in *the grid version* or *the schema version* of a document editor. Accordingly, the **Insert** button of the dialog box will be disabled if the current document is edited in grid mode.

Note: Some regular expressions may block indefinitely the Java Regular Expressions engine. If the execution of the regular expression does not end in about five seconds, the application displays a dialog box that allows you to interrupt the operation.

XML Schema 1.1

Oxygen XML Developer plugin offers full support for XML Schema 1.1, including:

- XML Documents Validation and Content Completion Based on XML Schema 1.1.
- XML Schema 1.1 Validation and Content Completion.
- Editing XML Schema 1.1 files in the Schema **Design** mode.
- The Flatten Schema action.

1.1.

- Resource Hierarchy/Dependencies and Refactoring Actions.
- · Master Files.
- Generating Documentation for XML Schema 1.1.
- Support for generating XML instances based on XML Schema.
- Support for validating XML documents with an NVDL schema that contains an XML Schema 1.1 validation step.
 - Note: To enable XML Schema 1.1 validation in NVDL, you need to pass the following option to the validation engine to specify the schema version:

 http://www.thaiopensource.com/validate/xsd-version (the possible values are 1.0 or
 - Note: To enable the full XPath expression in assertions and type alternatives, you need to set the http://www.thaiopensource.com/validate/full-xpath option.

XML Schema 1.1 is a superset of XML Schema 1.0, that offers lots of new powerful capabilities.

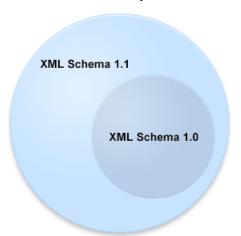

Figure 122: XML Schema 1.1

The significant new features in XSD 1.1 are:

 Assertions - support to define assertions against the document content using XPath 2.0 expressions (an idea borrowed from Schematron).

- Conditional type assignment the ability to select the type against which an element is validated based on the
 values of the attribute of the element.
- **Open content** content models are able to use the openContent element to specify content models with *open content*. These content models allow elements not explicitly mentioned in the content model to appear in the document instance. It is as if wildcards were automatically inserted at appropriate points within the content model. A schema document wide default may be set, which causes all content models to be open unless specified otherwise.

To see the complete list with changes since version 1.0, go to http://www.w3.org/TR/xmlschema11-1/#ch_specs.

XML Schema 1.1 is intended to be mostly compatible with XML Schema 1.0 and to have approximately the same scope. It also addresses bug fixes and brings improvements that are consistent with the constraints on scope and compatibility.

Note: An XML document conforming to a 1.0 schema can be validated using a 1.1 validator, but an XML document conforming to a 1.1 schema may not validate using a 1.0 validator.

If you are constrained to use XML Schema 1.0 (for example if you develop schemas for a server that uses an XML Schema 1.0 validator which cannot be updated), change the default XML Schema version to 1.0. If you keep the default XML Schema version set to 1.1, the content completion window presents XML Schema 1.1 elements that you can insert accidentally in an 1.0 XML Schema. So even if you make a document invalid conforming with XML Schema 1.0, the validation process does not signal any issues.

To change the default XML Schema version, *open the Preferences dialog box* and go to XML > XML Parser > XML Schema.

To watch our video demonstration about the XML Schema 1.1 support, go to http://oxygenxml.com/demo/XML_Schema_11.html.

Setting the XML Schema Version

Oxygen XML Developer plugin lets you set the version of the XML Schema you are editing either in the **XML Schema** preferences page, or through the versioning attributes. If you want to use the versioning attributes, set the minVersion and maxVersion attributes, from the http://www.w3.org/2007/XMLSchema-versioning namespace, on the schema root element.

Note: The versioning attributes take priority over the XML Schema version defined in the preferences page.

Table 3: Using the minversion and maxversion Attributes to Set the XML Schema Version

Versioning Attributes	XML Schema Version
minVersion = "1.0" maxVerion = "1.1"	1.0
minVersion = "1.1"	1.1
minVersion = "1.0" maxVerion = greater than "1.1"	the XML Schema version defined in the XML Schema preferences page.
Not set in the XML Schema document.	the XML Schema version defined in the XML Schema preferences page.

To change the XML Schema version of the current document, use the **Change XML Schema version** action from the contextual menu. This is available both in the **Text** mode, and in the **Design** mode and opens the **Change XML Schema version** dialog box. The following options are available:

- **XML Schema 1.0** Inserts the minVersion and maxVersion attributes on the schema element and gives them the values "1.0" and "1.1" respectively. Also, the namespace declaration (*xmlns:vc=http://www.w3.org/2007/XMLSchema-versioning*) is inserted automatically if it does not exist.
- **XML Schema 1.1** Inserts the minVersion attribute on the schema element and gives it the value "1.1". Also, removes the maxVersion attribute if it exists and adds the versioning namespace (*xmlns:vc=http://www.w3.org/2007/XMLSchema-versioning*) if it is not declared.

• **Default XML Schema version** - Removes the minVersion and maxVersion attributes from the schema element. The default schema version, defined in the **XML Schema** preferences page, is used.

Note: The **Change XML Schema version** action is also available in the informative panel presented at the top of the edited XML Schema. If you close this panel, it will no longer appear until you restore Oxygen XML Developer plugin to its default options.

Oxygen XML Developer plugin automatically uses the version set through the versioning attributes, or the default version if the versioning attributes are not declared, when proposing content completion elements and validating an XML Schema. Also, the XML instance validation against an XML Schema is aware of the versioning attributes defined in the XML Schema.

When you generate sample XML files from an XML Schema, Oxygen XML Developer plugin takes into account the minVersion and maxVersion attributes defined in the XML Schema.

Editing XQuery Documents

This section explains the features of the XQuery editor and how to use them.

XQuery Outline View

The XQuery document structure is presented in the XQuery **Outline** view. The outline tree presents the list of all the components (namespaces, imports, variables, and functions) from both the edited XQuery file and its imports. It allows quick access to components and can be opened from **Window** > **Show View** > **Outline**.

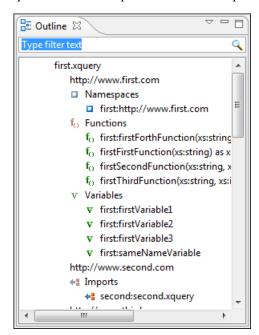

Figure 123: XQuery Outline View

The following actions are available in the View menu on the Outline view action bar:

Selection update on cursor move

Controls the synchronization between **Outline** view and source document. The selection in the **Outline** view can be synchronized with the cursor moves or the changes performed in the XQuery editor. Selecting one of the components from the **Outline** view also selects the corresponding item in the source document.

♣ Sort

Allows you to alphabetically sort the XQuery components.

Show all components

Displays all collected components starting from the current file. This option is set by default.

Show only local components

Displays the components defined in the current file only.

Group by location/namespace/type

Allows you to group the components by location, namespace, and type. When grouping by namespace, the main XQuery module namespace is presented first in the **Outline** view.

If you know the component name, you can search it in the **Outline** view by typing its name in the filter text field from the top of the view or directly on the tree structure. When you type the component name in the filter text field you can switch to the tree structure using the arrow keys of the keyboard, (**Enter**), (**Tab**), (**Shift-Tab**). To switch from tree structure to the filter text field, you can use (**Tab**), (**Shift-Tab**).

Tip: The search filter is case insensitive. The following wildcards are accepted:

- * any string
- ? any character
- , patterns separator

If no wildcards are specified, the string to search is used as a partial match (like *textToFind*).

The upper part of the **Outline** view contains a filter box that allows you to focus on the relevant components. Type a text fragment in the filter box and only the components that match it are presented. For advanced usage you can use wildcard characters (*, ?) and separate multiple patterns with commas.

Folding in XQuery Documents

In a large XQuery document, the instructions enclosed in the '{' and '}' characters can be collapsed so that only the needed instructions remain in focus. The same *folding features available for XML documents* are also available in XQuery documents.

```
let $minRating := min($review/reviews/review[@movie-id = $movie-id]/rating)
return
 <movie id="{$movie/@id}">
  {$movie/title}
  {Smovie/vear}
 <avgRating>
         if ($avgRating) then $avgRating else "not rated"
      }
 </avgRating>
  <maxRating>
      <value>
        { ...
      </value>
      { ...
  </maxRating>
  <minRating>
      <value>
        { ...
      </value>
      { ...
  </minRating>
 </movie>
```

Figure 124: Folding in XQuery Documents

There is available the action **Go to Matching Bracket** <u>Ctrl Shift G</u> on contextual menu of XQuery editor for going to matching character when cursor is located at '{' character or '}' character. It helps for finding quickly matching character of current folding element.

Formatting and Indenting XQuery Documents

Editing XQuery documents may lead to large chunks of content that are not easily readable by human audience. Also, each developer may have a particular way of writing XQuery code. Oxygen XML Developer plugin assists you in maintaining a consistent code writing style with the **Format and Indent** action that is available in the **Document** > **Source** menu and also on the toolbar.

The **Format and Indent** action achieves this by performing the following steps:

- Manages whitespaces, by collapsing or inserting space characters where needed.
- Formats complex expressions on multiple, more readable lines by properly indenting each of them. The amount of whitespaces that form an indent unit is controlled through one of the **Indent with tabs** and **Indent size** options from the *Format Preferences page*.
- 류

Note: These operations can be performed only if your XQuery document conforms with W3C XQuery 1.0, XQuery Update Facility 1.0, and XQuery 3.0 specifications. If the *Format and Indent* operation fails, the document is left unaltered and an error message is presented in the **Results** view.

Generating HTML Documentation for an XQuery Document

To generate HTML documentation for an XQuery document, use the **XQuery Documentation** dialog box. It is opened with the **XQuery Documentation** action that is available from the **XML Tools** > **Generate Documentation** menu or from the **Generate XQuery Documentation** action from the contextual menu of the **Navigator** view.

The dialog box allows you to configure a set of parameters for the process of generating the HTML documentation.

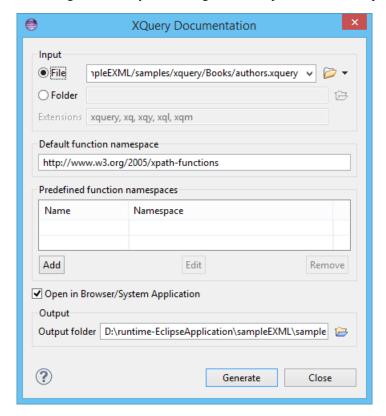

Figure 125: The XQuery Documentation Dialog Box

The following options are available:

- Input The full path to the XQuery file must be specified in one of the two fields in this section:
 - URLFile The URL of the file in which you want to generate the documentation.

- **Folder** The directory that contains the files for which you want to generate the documentation. You can also specify the XQuery file extensions to be searched for in the specified directory.
- Default function namespace Optional URI for the default namespace for the submitted XQuery.
- **Predefined function namespaces** Optional, engine-dependent, predefined namespaces that the submitted XQuery refers to. They allow the conversion to generate annotation information to support the presentation component hypertext linking (only if the predefined modules have been loaded into the local xqDoc XML repository).
- Open in Browser/System Application Select this option if you want the result to be opened in the system application
 associated with that file type.
 - E

Note: To set the browser or system application that will be used, *open the Preferences dialog box*, then go to **General** > **Web Browser**. This will take precedence over the default system application settings.

Output - Allows you to specify where the generated documentation is saved on disk.

Editing WSDL Documents

WSDL is an XML format for describing network services as a set of endpoints operating on messages containing either document-oriented or procedure-oriented information. The operations and messages are described abstractly, and then bound to a concrete network protocol and message format to define an endpoint. Related concrete endpoints are combined into abstract endpoints (services).

Oxygen XML Developer plugin provides a special type of editor dedicated to WSDL documents. The WSDL editor offers support to check whether a WSDL document is valid, a specialized Content Completion Assistant, a component oriented **Outline** view, searching and refactoring operations, and support to generate documentation.

Both WSDL version 1.1 and 2.0 are supported and SOAP versions 1.1 and 1.2. That means that in the location where a SOAP extension can be inserted the **Content Completion Assistant** offers elements from both SOAP 1.1 and SOAP 1.2. Validation of SOAP requests is executed first against a SOAP 1.1 schema and then against a SOAP 1.2 schema. In addition to validation against the XSD schemas, Oxygen XML Developer plugin also checks if the WSDL file conforms with the WSDL specification (available only for WSDL 1.1 and SOAP 1.1).

In the following example you can see how the errors are reported.

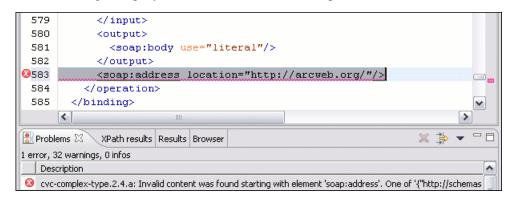

Figure 126: Validating a WSDL file

To watch our video demonstration about the WSDL editing support in Oxygen XML Developer plugin, go to http://www.oxygenxml.com/demo/Create_New_WSDL.html.

WSDL Outline View

The WSDL **Outline** view displays the list of all the components (services, bindings, port types and so on) of the currently open WSDL document along with the components of its imports.

If you use the *Master Files support*, the **Outline** view collects the components of a WSDL document starting from the master files of the current document.

To enable the **Outline** view, go to **Window** > **Show View** > **Outline**.

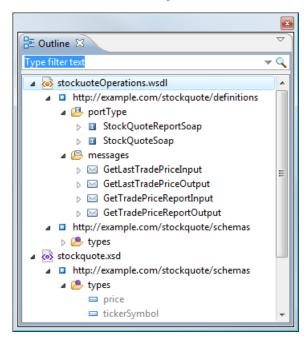

Figure 127: The WSDL Outline View

The **Outline** view can display both the components of the current document and its XML structure, organized in a tree-like fashion. You can switch between the display modes by using the **Show XML structure** and **Show components** actions in the **View menu** on the **Outline** view action bar. The following actions are available:

Filter returns exact matches

The text filter of the **Outline** view returns only exact matches.

Selection update on cursor move

Controls the synchronization between the **Outline** view and the current document. The selection in the **Outline** view can be synchronized with the cursor moves or the changes in the WSDL editor. Selecting one of the components from the **Outline** view also selects the corresponding item in the current document.

When the **Show components** option is selected, the following actions are available:

Show XML structure

Displays the XML structure of the current document in a tree-like manner.

♣ Sort

Sorts the components in the **Outline** view alphabetically.

Show all components

Displays all the components that were collected starting from current document or from the main document, if it is defined.

Show referable components

Displays all the components that you can reference from the current document.

Show only local components

Displays the components defined in the current file only.

Group by location

Groups the WSDL components by their location.

Group by type

Groups the WSDL components by their type.

Group by namespace

Groups the WSDL components by their namespace.

Note: By default all the three grouping criteria are active.

When the **Show XML structure** option is selected, the following actions are available:

Show components

Switches the **Outline** view to the components display mode.

Flat presentation mode of the filtered results

When active, the application flattens the filtered result elements to a single level.

Show comments and processing instructions

Show/hide comments and processing instructions in the Outline view.

Show element name

Show/hide element name.

T Show text

Show/hide additional text content for the displayed elements.

Show attributes

Show/hide attribute values for the displayed elements. The displayed attribute values can be changed from *the Outline preferences panel*.

Configure displayed attributes

Displays the XML Structured Outline preferences page.

The following contextual menu actions are available in the **Outline** view when the **Show components** option is selected in the **View menu**:

Edit Attributes

Opens a dialog box that allows you to edit the attributes of the currently selected component.

& Cut

Cuts the currently selected component.

Copies the currently selected component.

X Delete

Deletes the currently selected component.

Search references

Searches for the references of the currently selected component.

Search references in

Searches for the references of the currently selected component in the context of a scope that you define.

Component dependencies

Displays the dependencies of the currently selected component.

Resource Hierarchy

Displays the hierarchy for the currently selected resource.

Resource Dependencies

Displays the dependencies of the currently selected resource.

EN Rename Component in

Renames the currently selected component in the context of a scope that you define.

The following contextual menu actions are available in the **Outline** view when the **Show XML structure** option is selected in the **View menu**:

Append Child

Displays a list of elements that you can insert as children of the current element.

Insert Before

Displays a list of elements that you can insert as siblings of the current element, before the current element.

Insert After

Displays a list of elements that you can insert as siblings of the current element, after the current element.

Edit Attributes

Opens a dialog box that allows you to edit the attributes of the currently selected component.

→! Toggle Comment

Comments/uncomments the currently selected element.

Searches for the references of the currently selected component.

Search references in

Searches for the references of the currently selected component in the context of a scope that you define.

Component dependencies

Displays the dependencies of the currently selected component.

EN Rename Component in

Renames the currently selected component in the context of a scope that you define.

₩ Cut

Cuts the currently selected component.

Copies the currently selected component.

X Delete

Deletes the currently selected component.

Expand All

Expands the structure of a component in the **Outline** view.

Collapse All

Collapses the structure of all the component in the **Outline** view.

To switch from the tree structure to the text filter, use **Tab** and **Shift-Tab**.

- **Tip:** The search filter is case insensitive. The following wildcards are accepted:
 - * any string
 - ? any character
 - , patterns separator

If no wildcards are specified, the string to search is used as a partial match (like *textToFind*).

The content of the **Outline** view and the editing area are synchronized. When you select a component in the **Outline** view, its definition is highlighted in the editing area.

The **Content Completion Assistant** is a powerful feature that enhances the editing of WSDL documents. It helps you define WSDL components by proposing context-sensitive element names. Another important capability of the **Content Completion Assistant** is to propose references to the defined components when you edit attribute values. For example, when you edit the type attribute of a binding element, the **Content Completion Assistant** proposes all the defined port types. Each proposal that the **Content Completion Assistant** offers is accompanied by a documentation hint.

Note: XML schema specific elements and attributes are offered when the current editing context is the internal XML schema of a WSDL document.

Figure 128: WSDL Content Completion Window

Note: The **Content Completion Assistant** collects its components starting from the master files. The master files can be defined in the project or in the associated validation scenario. For further details about the **Master Files** support go to *Defining Master Files at Project Level*.

Namespace prefixes in the scope of the current context are presented at the top of the content completion window to speed up the insertion into the document of prefixed elements.

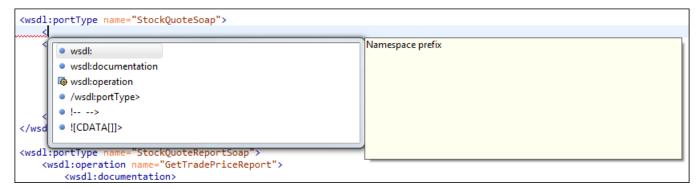

Figure 129: Namespace Prefixes in the Content Completion Window

For the common namespaces, like XML Schema namespace (http://www.w3.org/2001/XMLSchema) or SOAP namespace (http://schemas.xmlsoap.org/wsdl/soap/), Oxygen XML Developer plugin provides an easy mode to declare them by proposing a prefix for these namespaces.

Editing WSDL Documents in the Master Files Context

Smaller interrelated modules that define a complex WSDL structure cannot be correctly edited or validated individually, due to their interdependency with other modules. Oxygen XML Developer plugin provides the support for defining the main module (or modules), allowing you to edit any of the imported/included files in the context of the larger WSDL structure.

You cat set a main WSDL document either using the *master files support from the Navigator view*, or using a validation scenario.

To set a main file using a validation scenario, add validation units that point to the main modules. Oxygen XML Developer plugin warns you if the current module is not part of the dependencies graph computed for the main WSDL document. In this case, it considers the current module as the main WSDL document.

The advantages of editing in the context of a master file include:

- Correct validation of a module in the context of a larger WSDL structure.
- Content Completion Assistant displays all components valid in the current context.
- The **Outline** displays the components collected from the entire WSDL structure.

Note: When you edit an XML schema document that has a WSDL document set as master, the validation operation is performed over the master WSDL document.

To watch our video demonstration about editing WSDL documents in the master files context, go to http://oxygenxml.com/demo/WSDL_Working_Modules.html.

Searching and Refactoring Operations in WSDL Documents

Search Actions

The following search actions are available from the Search submenu in the contextual menu of the current editor:

- Search References Searches all references of the item found at current cursor position in the defined scope, if any. If a scope is defined, but the current edited resource is not part of the range of resources determined by this, a warning dialog box is displayed and you have the possibility to define another search scope.
- **Search References in** Searches all references of the item found at current cursor position in the file or files that you specify when define a scope in the **Search References** dialog box.
- Search Declarations Searches all declarations of the item found at current cursor position in the defined scope if any. If a scope is defined, but the current edited resource is not part of the range of resources determined by this, a warning dialog box will be displayed and you have the possibility to define another search scope.
- **Search Declarations in** Searches all declarations of the item found at current cursor position in the file or files that you specify when you define a scope for the search operation.
- Search Occurrences in File Searches all occurrences of the item at the cursor position in the currently edited file.

The following action is available from the **WSDL** menu:

- Show Definition Takes you to the location of the definition of the current item.

Note: You can also use the <u>Ctrl Single-Click (Command Single-Click on OS X)</u> shortcut on a reference to display its definition.

Refactoring Actions

The following refactoring actions are available from the **Refactoring** submenu in the contextual menu of the current editor:

- **Rename Component** Allows you to rename the current component in-place. The component and all its references in the document are highlighted with a thin border and the changes you make to the component at the cursor position are updated in real time to all occurrences of the component. To exit in-place editing, press the **Esc** or **Enter** key on your keyboard.
- Rename Component in Opens the Rename *component_type* dialog box that allows you to rename the selected component by specifying the new component name and the files to be affected by the modification. If you click the **Preview** button, you can view the files affected by the **Rename Component** action.

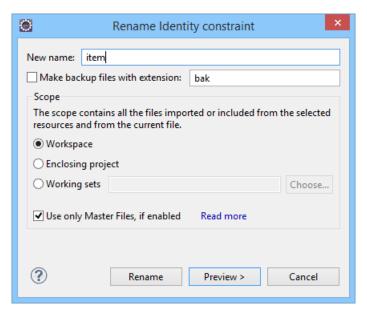

Figure 130: Rename Identity Constraint Dialog Box

Searching and Refactoring Operations Scope in WSDL Documents

The *scope* is a collection of documents that define the context of a search and refactor operation. To control it you can use the **Change scope** operation, available in the Quick Fix action set or on the **Resource Hierarchy/Dependency View** toolbar. You can restrict the scope to the current project or to one or multiple working sets. The **Use only Master Files, if enabled** check-box allows you to restrict the scope of the search and refactor operations to the resources from the **Master Files** directory. Click **read more** for details about the *Master Files support*.

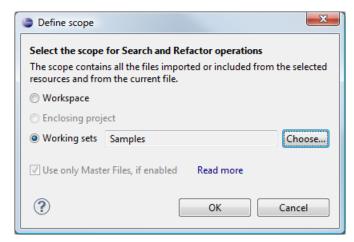

Figure 131: Change Scope Dialog Box

The scope you define is applied to all future search and refactor operations until you modify it. Contextual menu actions allow you to add or delete files, folders, and other resources to the working set structure.

WSDL Resource Hierarchy/Dependencies View in WSDL Documents

The **Resource Hierarchy/Dependencies** view allows you to see the hierarchy/dependencies for a WSDL resource. To open this view, go to **Window** > **Show View** > **Other** > **Oxygen XML Developer plugin** > **Resource Hierarchy/Dependencies**.

Note: The hierarchy of a WSDL resource includes the hierarchy of imported XML Schema resources. The dependencies of an XML Schema resource present the WSDL documents that import the schema.

To view the hierarchy of a WSDL document, select the document in the project view and choose **Resource Hierarchy** from the contextual menu.

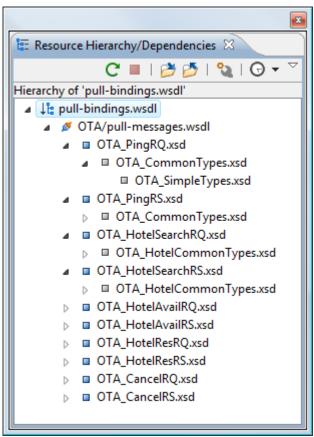

Figure 132: Resource Hierarchy/Dependencies View

If you want to see the dependencies of a WSDL document, select the document in the project view and choose **Resource Dependencies** from the contextual menu.

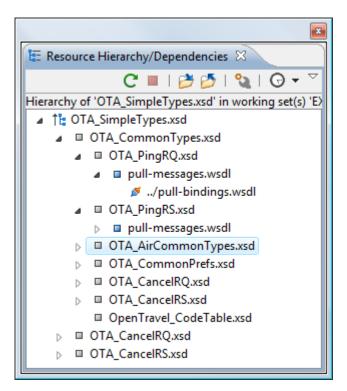

Figure 133: Resource Hierarchy/Dependencies View

The following actions are available in the Resource Hierarchy/Dependencies view:

C Refresh

Refreshes the Hierarchy/Dependencies structure.

Stop

Stops the hierarchy/dependencies computing.

Show Hierarchy

Allows you to choose a resource to compute the hierarchy structure.

Show Dependencies

Allows you to choose a resource to compute the dependencies structure.

Configure

Allows you to configure a scope to compute the dependencies structure. There is also an option for automatically using the defined scope for future operations.

O. History

Provides access to the list of previously computed dependencies. Use the * Clear history button to remove all items from this list.

The contextual menu contains the following actions:

Open

Opens the resource. You can also double-click a resource in the Hierarchy/Dependencies structure to open it.

Copy location

Copies the location of the resource.

Move resource

Moves the selected resource.

Rename resource

Renames the selected resource.

Show Resource Hierarchy

Shows the hierarchy for the selected resource.

Show Resource Dependencies

Shows the dependencies for the selected resource.

Add to Master Files

Adds the currently selected resource in the Master Files directory.

Expand All

Expands all the children of the selected resource from the Hierarchy/Dependencies structure.

Collapse All

Collapses all children of the selected resource from the Hierarchy/Dependencies structure.

Tip: When a recursive reference is encountered in the Hierarchy view, the reference is marked with a special icon \$.

Note: The Move resource or Rename resource actions give you the option to update the references to the resource.

Moving/Renaming WSDL Resources

You are able to move and rename a resource presented in the **Resource/Hierarchy Dependencies** view, using the **Rename resource** and **Move resource** refactoring actions from the contextual menu.

When you select the Rename action in the contextual menu of the Resource/Hierarchy Dependencies view, the **Rename resource** dialog box is displayed. The following fields are available:

- **New name** Presents the current name of the edited resource and allows you to modify it.
- **Update references** Enable this option to update the references to the resource you are renaming.

When you select the Move action from the contextual menu of the Resource/Hierarchy Dependencies view, the Move **resource** dialog box is displayed. The following fields are available:

- **Destination** Presents the path to the current location of the resource you want to move and gives you the option to introduce a new location.
- New name Presents the current name of the moved resource and gives you the option to change it.
- **Update references of the moved resource(s)** Enable this option to update the references to the resource you are moving, in accordance with the new location and name.

If the **Update references of the moved resource(s)** option is enabled, a **Preview** option (which opens the **Preview** dialog box) is available for both actions. The **Preview** dialog box presents a list with the resources that are updated.

Component Dependencies View in WSDL Documents

The Component Dependencies view allows you to view the dependencies for a selected WSDL component. To open the Component Dependencies view, go to Window > Show View > Other > Oxygen XML Developer plugin > Component Dependencies.

To view the dependencies of an WSDL component, select the desired component in the editor and choose the Component Dependencies action from the contextual menu. This action is available for all WSDL components (messages, port types, operations, bindings and so on).

Note: If you search for dependencies of XML Schema elements, the **Component Dependencies** view presents the references from WSDL documents.

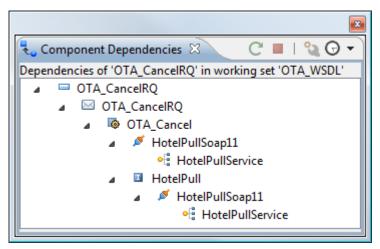

Figure 134: Component Dependencies View

The following action are available in the toolbar of the **Component Dependencies** view:

C Refresh

Refreshes the dependencies structure.

Stop

Stops the dependencies computing.

Configure

Allows you to configure a *search scope* to compute the dependencies structure. You can decide to use the defined scope for future operations automatically, by checking the corresponding check box.

O. History

Allows you to repeat a previous dependencies computation.

The following actions are available in the contextual menu of the Component Dependencies view:

Go to First Reference

Selects the first reference of the referenced component from the current selected component in the dependencies tree.

Go to Component

Displays the definition of the current selected component in the dependencies tree.

Tip: If a component contains multiple references to another, a small table is displayed that contains all references. When a recursive reference is encountered, it is marked with a special icon \$\mathcal{G}\$.

Highlight Component Occurrences in WSDL Documents

When you position your mouse cursor over a component in a WSDL document, Oxygen XML Developer plugin searches for the component declaration and all its references and highlights them automatically.

Customizable colors are used: one for the component definition and another one for component references. Occurrences are displayed until another component is selected.

To change the default behavior of **Highlight Component Occurrences**, *open the Preferences dialog box* and go to **Editor** > **Mark Occurrences**. You can also trigger a search using the **Search Occurrences in File** () action from contextual menu. Matches are displayed in separate tabs of the **Results** view.

Quick Assist Support in WSDL Documents

The *Quick Assist* feature is activated automatically when the cursor is positioned over the name of a component. It is accessible via a yellow bulb help marker placed on the cursor line, in the line number stripe on the left side of the editor. Also, you can invoke the quick assist menu by using the **Ctrl** + **1** keys (**Meta 1** on Mac OS X) keyboard shortcuts.

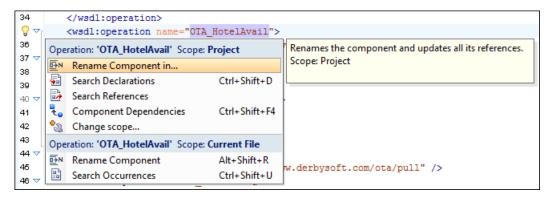

Figure 135: WSDL Quick Assist Support

The quick assist support offers direct access to the following actions:

EN Rename Component in

Renames the component and all its dependencies.

Search Declarations

Searches the declaration of the component in a predefined scope. It is available only when the context represents a component name reference.

Search References

Searches all references of the component in a predefined scope.

Component Dependencies

Searches the component dependencies in a predefined scope.

Change Scope

Configures the scope that will be used for future search or refactor operations.

EN Rename Component

Allows you to rename the current component in-place.

Search Occurrences

Searches all occurrences of the component within the current file.

Generating Documentation for WSDL Documents

You can use Oxygen XML Developer plugin to generate detailed documentation for the components of a WSDL document in HTML format. You can select the WSDL components to include in your output and the level of details to present for each of them. Also, the components are hyperlinked. You can also generate the documentation in a *custom output format* by using a custom stylesheet.

Note: The WSDL documentation includes the XML Schema components that belong to the internal or imported XML schemas.

To generate documentation for a WSDL document, select **WSDL Documentation** from the **XML Tools** > **Generate Documentation** menu or from the **Generate WSDL Documentation** action from the contextual menu of the **Navigator** view.

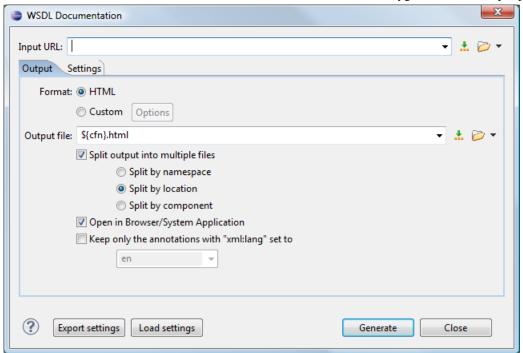

Figure 136: The WSDL Documentation Dialog Box

The **Input URL** field of the dialog box must contain the full path to the WSDL document that you want to generate documentation for. The WSDL document may be a local or a remote file. You can specify the path to the WSDL file by entering it in the text field, or by using the ... **Insert Editor Variables** button or the options in the ... **Browse** drop-down menu.

The Output Tab

The following options are available in the **Output** tab:

- Format Allows you to choose between the following formats:
 - **HTML** The documentation is generated in *HTML output format*.
 - Custom The documentation is generated in a custom output format, allowing you to control the output. Click
 the Options button to open a Custom format options dialog box where you can specify a custom stylesheet for
 creating the output. There is also an option to Copy additional resources to the output folder and you can
 select the path to the additional Resources that you want to copy. You can also choose to keep the intermediate
 XML files created during the documentation process by deselecting the Delete intermediate XML file option.
- Output file You can specify the path of the output file by entering it in the text field, or by using the Linsert Editor Variables button or the options in the Frowse drop-down menu.
- **Split output into multiple files** Instructs the application to split the output into multiple files. For large WSDL documents, choosing a different split criterion may generate smaller output files providing a faster documentation browsing. You can choose to split them by namespace, location, or component name.
- Open in Browser/System Application Opens the result in the system application associated with the output file type.
 - Note: To set the browser or system application that will be used, *open the Preferences dialog box*, then go to General > Web Browser. This will take precedence over the default system application settings.
- **Keep only the annotations with xml:lang set to** The generated output will contain only the annotations with the xml:lang attribute set to the selected language. If you choose a primary language code (for example, **en** for English), this includes all its possible variations (**en-us**, **en-uk**, etc.).

The Setting Tab

When you generate documentation for a WSDL document, you can choose what components to include in the output and the details to be included in the documentation.

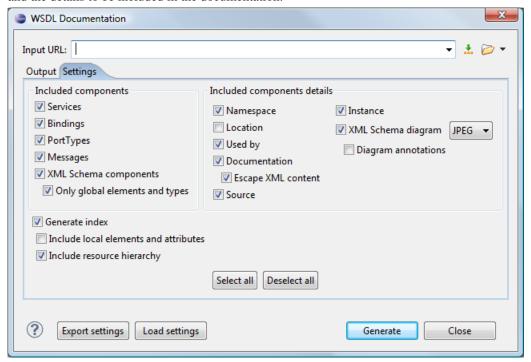

Figure 137: The Settings Tab of the WSDL Documentation Dialog Box

The **Settings** tab allows you to choose whether or not to include the following:

Components

- Services Specifies whether the generated documentation includes the WSDL services.
- **Bindings** Specifies whether the generated documentation includes the WSDL bindings.
- Port Types Specifies whether the generated documentation includes the WSDL port types.
- Messages Specifies whether the generated documentation includes the WSDL messages.
- XML Schema Components Specifies whether the generated documentation includes the XML Schema components.
 - Only global elements and types Specifies whether the generated documentation includes only global elements and types.

Component Details

- Namespace Presents the namespace information for WSDL or XML Schema components.
- Location Presents the location information for each WSDL or XML Schema component.
- Used by Presents the list of components that reference the current one.
- **Documentation** Presents the component documentation. If you choose **Escape XML Content**, the XML tags are presented in the documentation.
- **Source** Presents the XML fragment that defines the current component.
- **Instance** Generates a sample XML instance for the current component.
 - **Note:** This option applies to the XML Schema components only.
- XML Schema Diagram Displays the diagram for each XML Schema component. You can choose the image format (JPEG, PNG, SVG) to use for the diagram section.

- Diagram annotations Specifies whether the annotations of the components presented in the diagram sections
 are included.
- Generate index Displays an index with the components included in the documentation.
 - Include local elements and attributes If checked, local elements and attributes are included in the documentation
 index.
 - **Include resource hierarchy** Specifies whether the resource hierarchy for an XML Schema documentation is generated.

Export settings - Save the current settings in a settings file for further use (for example, with the exported settings file you can generate the same *documentation from the command-line interface*.)

Load settings - Reloads the settings from the exported file.

Generate - Use this button to generate the WSDL documentation.

Generating WSDL Documentation in HTML Format

The WSDL documentation generated in HTML format is presented in a visual diagram style with various sections, hyperlinks, and options.

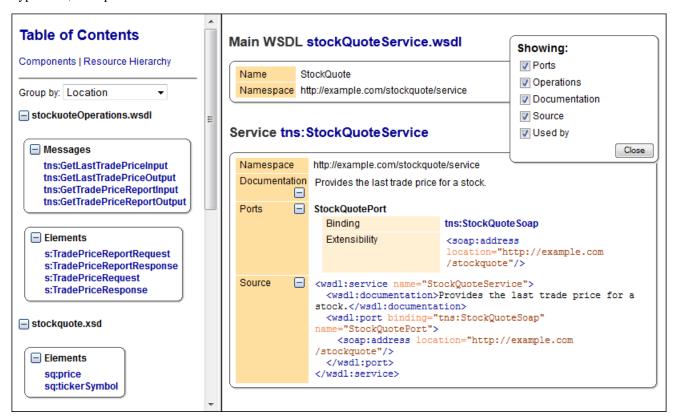

Figure 138: WSDL Documentation in HTML Format

The documentation of each component is presented in a separate section. The title of the section is composed of the component type and the component name. The component information (namespace, documentation, etc.) is presented in a tabular form.

If you choose to split the output into multiple files, the table of contents is displayed in the left frame and is divided in two tabs: **Components** and **Resource Hierarchy**.

The **Components** tab allows you to group the contents by namespace, location, or component type. The WSDL components from each group are sorted alphabetically. The **Resource Hierarchy** tab displays the dependencies between

WSDL and XML Schema modules in a tree like fashion. The root of the tree is the WSDL document that you generate documentation for.

After the documentation is generated, you can collapse or expand details for some WSDL components by using the **Showing** options or the \Box **Collapse** or \Box **Expand** buttons.

Figure 139: The Showing Options

Generating WSDL Documentation in a Custom Format

To obtain the default HTML documentation output from a WSDL document, Oxygen XML Developer plugin uses an intermediary XML document to which it applies an XSLT stylesheet. To create a custom output from your WSDL document, edit the wsdlDocHtml.xsl XSLT stylesheet or create your own.

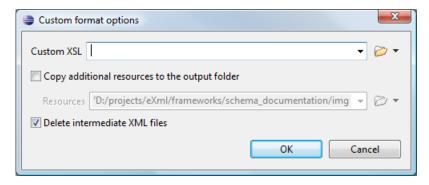

Figure 140: The Custom Format Options Dialog Box

When using a custom format, you can also copy additional resources into the output folder or choose to keep the intermediate XML files created during the documentation process.

Generating WSDL Documentation from the Command-Line Interface

To generate documentation for a WSDL document from the command line, open the **WSDL Documentation** dialog box and click **Export settings**. Using the exported settings file you can generate the same documentation from the command line by running the following scripts:

- wsdlDocumentation.bat on Windows.
- wsdlDocumentation.sh on Unix / Linux.
- wsdlDocumentationMac.sh on Mac OS X.

The scripts are located in the installation folder of Oxygen XML Developer plugin. You can integrate the scripts in an external batch process launched from the command-line interface.

WSDL SOAP Analyzer

After you edit and validate your Web service descriptor against a mix of the XML Schemas for WSDL and SOAP, it is easy to check if the defined SOAP messages are accepted by the remote Web Services server using Oxygen XML Developer plugin's **WSDL SOAP Analyzer** integrated tool (Available .

Composing a SOAP Request

WSDL SOAP Analyzer is a tool that helps you test if the messages defined in a Web Service Descriptor (WSDL) are accepted by a Web Services server.

Oxygen XML Developer plugin provides two ways of testing, one for the currently edited WSDL document and another for the remote WSDL documents that are published on a web server. To open the WSDL SOAP Analyzer tool for the currently edited WSDL document do one of the following:

- Click the **WSDL SOAP Analyzer** toolbar button.
- Use the **SOAP Analyzer** action from the **WSDL** menu.
- Go to Open with > WSDL Editor in the contextual menu of the Navigator view.

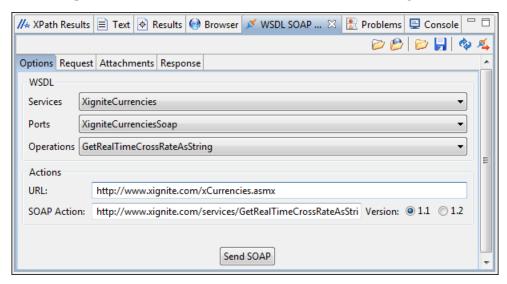

Figure 141: WSDL SOAP Analyzer View

This tool contains a SOAP analyzer and sender for Web Services Description Language file types. The analyzer fields are as follows:

- Services The list of services defined by the WSDL file.
- **Ports** The ports for the selected service.
- **Operations** The list of available operations for the selected service.
- Action URL The script that serves the operation.
- **SOAP Action** Identifies the action performed by the script.
- Version Choose between 1.1 and 1.2. The SOAP version is selected automatically depending on the selected port.
- **Request Editor** It allows you to compose the web service request. When an action is selected, Oxygen XML Developer plugin tries to generate as much content as possible for the SOAP request. The envelope of the SOAP request has the correct namespace for the selected SOAP version, that is http://schemas.xmlsoap.org/soap/envelope/ for SOAP 1.1 or http://www.w3.org/2003/05/soap-envelope for SOAP 1.2. Usually you just have to change few values in order for the request to be valid. The content completion assistant is available for this editor and is driven by the schema that defines the type of the current message. While selecting different operations, Oxygen XML Developer plugin remembers the modified request for each one. You can press the **Regenerate** button in order to overwrite your modifications for the current request with the initial generated content.
- Attachments List You can define a list of file URLs to be attached to the request.

- Response Area Initially it displays an auto generated server sample response so you can have an idea about how
 the response looks like. After pressing the Send button, it presents the message received from the server in response
 to the Web Service request. It may show also error messages. If the response message contains attachments, Oxygen
 XML Developer plugin prompts you to save them, then tries to open them with the associated system application.
- Errors List There may be situations in which the WSDL file is respecting the WSDL XML Schema, but it fails to be valid for example in the case of a message that is defined by means of an element that is not found in the types section of the WSDL. In such a case, the errors are listed here. This list is presented only when there are errors.
- **Send Button** Executes the request. A status dialog box is displayed when Oxygen XML Developer plugin is connecting to the server.

The testing of a WSDL file is straight-forward: click the WSDL analysis button, then select the service, the port, and the operation. The editor generates the skeleton for the SOAP request. You can edit the request, eventually attach files to it and send it to the server. Watch the server response in the response area. You can find more details in the *Testing Remote WSDL Files* section.

Note: SOAP requests and responses are automatically validated in the **WSDL SOAP Analyzer** using the XML Schemas specified in the WSDL file.

Once defined, a request derived from a Web Service descriptor can be saved with the **Save** button to a Web Service SOAP Call (WSSC) file for later reuse. In this way, you save time in configuring the URLs and parameters.

You can open the result of a Web Service call in an editor panel using the **Open** button.

Testing Remote WSDL Files

To open and test a remote WSDL file the steps are the following:

- 1. Go to Window > Show View > Other > Oxygen XML Developer plugin > ▶ WSDL SOAP Analyzer.
- 2. Press the Choose WSDL button and enter the URL of the remote WSDL file.

You enter the URL:

- by typing
- by browsing the local file system
- by browsing a remote file system
- by browsing a *UDDI Registry*
- **3.** Press the **OK** button.

This will open the **WSDL SOAP Analyzer** tool. In the **Saved SOAP Request** tab you can open directly a previously saved Web Service SOAP Call (WSSC) file thus skipping the analysis phase.

The UDDI Registry Browser

Pressing the hand button in the WSDL File Opener dialog box (menu Tools > WSDL SOAP Analyzer) opens the UDDI Registry Browser dialog box.

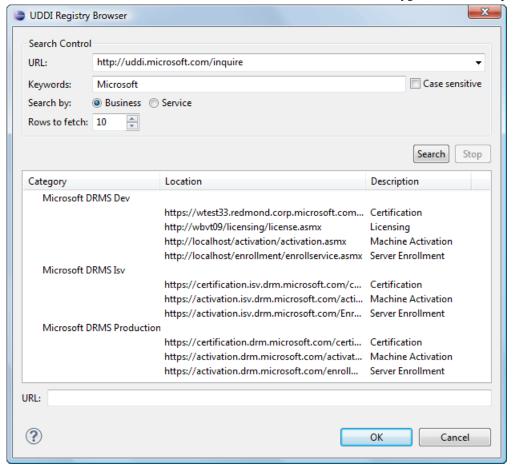

Figure 142: UDDI Registry Browser Dialog Box

The fields of the dialog box are as follows:

- URL Type the URL of an UDDI registry or choose one from the default list.
- **Keywords** Enter the string you want to be used when searching the selected UDDI registry for available Web services.
- Rows to fetch The maximum number of rows to be displayed in the result list.
- **Search by** You can choose to search either by company or by provided service.
- Case sensitive When checked, the search takes into account the keyword case.
- Search The WSDL files that matched the search criteria are added in the result list.

When you select a WSDL from the list and click the **OK** button, the **UDDI Registry Browser** dialog box is closed and you are returned to the **WSDL File Opener** dialog box.

Editing CSS Stylesheets

This section explains the features of the editor for CSS stylesheets and how these features should be used.

Validating CSS Stylesheets

Oxygen XML Developer plugin includes a built-in *CSS Validator*, integrated with general validation support. This makes the *usual validation features* for presenting errors also available for CSS stylesheets.

The CSS properties accepted by the validator are those included in the current CSS profile that is selected in *the CSS validation preferences*. The CSS 3 with Oxygen extensions profile includes all the CSS 3 standard properties and the

CSS extensions specific for Oxygen. That means all Oxygen specific extensions are accepted in a CSS stylesheet by *the built-in CSS validator* when this profile is selected.

Specify Custom CSS Properties

Lists the steps required for specifying custom CSS properties.

To specify custom CSS properties, follow these steps:

1. Create a file named CustomProperties.xml that has the following structure:

```
<?xml version="1.0" encoding="UTF-8"?>
<css_keywords
    xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
    xsi:schemaLocation="http://www.oxygenxml.com/ns/css http://www.oxygenxml.com/ns/css/CssProperties.xsd"

    xmlns="http://www.oxygenxml.com/ns/css">
    <property name="custom">
    <summary>Description for custom property.</summary>
        <value name="customValue"/>
        <value name="anotherCustomValue"/>
        </property>
</css_keywords>
```

- 2. Go to your desktop and create the builtin/css-validator/ folder structure.
- 3. Press and hold <u>Shift</u> and right-click anywhere on your desktop. From the contextual menu, select **Open Command** Window Here.
- **4.** In the command line, run the jar cvf custom_props.jar builtin/command. The custom props.jar file is created.
- **5.** Go to [OXYGEN_DIR]/lib and create the endorsed folder. Copy the custom_props.jar file to [OXYGEN_DIR]/lib/endorsed.

Content Completion in CSS Stylesheets

A Content Completion Assistant, similar to the one available for XML documents offers the CSS properties and the values available for each property. It is activated with the Ctrl Space (Command Space on OS X) shortcut and is context-sensitive when invoked for the value of a property. The Content Completion Assistant also includes code templates that can be used to quickly insert code fragments into CSS stylesheets. The code templates that are proposed include form controls, actions, and Author mode operations.

Figure 143: Content Completion in CSS Stylesheets

The properties and values available are dependent on the CSS Profile selected in the CSS preferences. The CSS 2.1 set of properties and property values is used for most of the profiles. However, with CSS 1 and CSS 3 specific proposal sets are used.

CSS Outline View

The CSS **Outline** view presents the import declarations for other CSS stylesheet files and all the selectors defined in the current CSS document. The selector entries can be presented as follows:

- In the order they appear in the document.
- Sorted by the element name used in the selector.
- Sorted by the entire selector string representation.

You can synchronize the selection in the **Outline** view with the cursor moves or changes you make in the stylesheet document. When you select an entry from the **Outline** view, Oxygen XML Developer plugin highlights the corresponding import or selector in the CSS editor.

To enable the **Outline** view, go to **Window** > **Show View** > **Outline**.

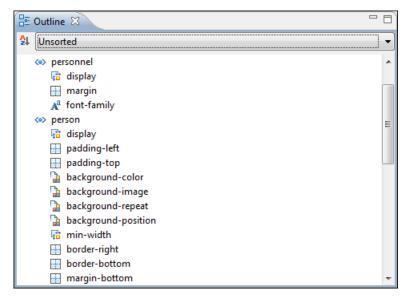

Figure 144: CSS Outline View

The selectors presented in this view can be found quickly using the key search field. When you press a sequence of character keys while the focus is in the view, the first selector that starts with that sequence is selected automatically.

Folding in CSS Stylesheets

In a large CSS stylesheet document, some styles can be collapsed so that only the styles that are needed remain in focus. The same *folding features available for XML documents* are also available in CSS stylesheets.

Note: To enhance your editing experience, you can select entire blocks (parts of text delimited by brackets) by double-clicking somewhere inside the brackets.

Formatting and Indenting CSS Stylesheets (Pretty Print)

If the edited CSS stylesheet becomes unreadable because of the bad alignment of the text lines, the *format and indent operation available for XML documents* is also available for CSS stylesheets. It works in the same way as for XML documents and is available as the same menu and toolbar action.

Minifying CSS Stylesheets

Minification (or *compression*) of a CSS document is the practice of removing unnecessary code without affecting the functionality of the stylesheet.

To minify a CSS, invoke the contextual menu anywhere in the edited document and choose the **Minify CSS** action. Oxygen XML Developer plugin opens a dialog box that allows you to:

- Set the location of the resulting CSS.
- Place each style rule on a new line.

After pressing **OK**, Oxygen XML Developer plugin performs the following actions:

- All spaces are normalized (all leading and trailing spaces are removed, while sequences of white spaces are replaced with single space characters).
- All comments are removed.

Note: The CSS minifier relies heavily upon the W3C CSS specification. If the content of the CSS file you are trying to minify does not conform with the specifications, an error dialog box will be displayed, listing all errors encountered during the processing.

The resulting CSS stylesheet gains a lot in terms of execution performance, but loses in terms of readability. The source CSS document is left unaffected.

Note: To restore the readability of a minified CSS, invoke the **Format and Indent** action from the **XML** menu, the **Source** submenu from the contextual menu, or **Source** toolbar. However, this action will not recover any of the deleted comments.

Editing LESS CSS Stylesheets

Oxygen XML Developer plugin provides support for stylesheets coded with the LESS dynamic stylesheet language. LESS extends the CSS language by adding features that allow mechanisms such as *variables*, *nesting*, *mixins*, *operators*, and *functions*. Oxygen XML Developer plugin offers additional LESS features that include:

- · Open LESS files the LESS extension is recognized and thus can be opened by the editor
- Validation presents errors in LESS files
- · Content completion offers properties and the values available for each property
- Compile to CSS options are available to compile LESS files to CSS

Note: Oxygen XML Developer plugin also support syntax highlighting in LESS files, although there may be some limitations in supporting all the LESS constructs.

For more information about LESS go to http://lesscss.org/.

Validating LESS Stylesheets

Oxygen XML Developer plugin includes a built-in *LESS CSS Validator*, integrated with general validation support. The *usual validation features* for presenting errors also available for LESS stylesheets.

Oxygen XML Developer plugin provides three validation methods:

- Automatic validation as you type marks validation errors in the document as you are editing.
- Validation upon request, by pressing the **Validate** button from the **Validation** toolbar drop-down menu. An error list is presented in the message panel at the bottom of the editor.
- Validation scenarios, by selecting ✓ Configure Validation Scenario(s) from the ✓ Validation toolbar drop-down menu. Errors are presented in the message panel at the bottom of the editor. This is useful when you need to validate the current file as part of a larger LESS import hierarchy (for instance, you may change the URL of the file to validate to the root of the hierarchy).

Content Completion in LESS Stylesheets

A **Content Completion Assistant** offers the LESS properties and the values available for each property. It is activated with the **Ctrl Space (Command Space on OS X)** shortcut and is context-sensitive when invoked for the value of a property in a LESS file. The **Content Completion Assistant** also includes *code templates that can be used to quickly insert code fragments* into LESS stylesheets. The code templates that are proposed include form controls, actions, and **Author** mode operations.

Figure 145: Content Completion in LESS Stylesheets

The properties and values available are dependent on the CSS Profile selected in the CSS preferences.

Compiling LESS Stylesheets to CSS

When editing LESS files, you can compile the files into CSS. Oxygen XML Developer plugin provides both manual and automatic options to compile LESS stylesheets into CSS.

Important: The LESS processor works well only with files having the *UTF-8* encoding. Thus, it is highly recommended that you always use the utf-8 encoding when working with LESS files or the files they import (other LESS or CSS files). You can use the following directive at the beginning of your files:

```
@charset "utf-8";
```

You have two options for compiling LESS files to CSS:

- 1. Use the contextual menu in a LESS file and select Compile to CSS (Ctrl Shift C (Meta Shift C on OS X)).
- 2. Enable the option Automatically compile LESS to CSS when saving in the settings. To do so, open the Preferences dialog box and go to Editor > Open > Save > Save hooks. If enabled, when you save a LESS file it will automatically be compiled to CSS (this option is disabled by default).

Important: If this option is enabled, when you save a LESS file, the CSS file that has the same name as the LESS file is overwritten without warning. Make sure all your changes are made in the LESS file. Do not edit the CSS file directly, as your changes might be lost.

Editing Relax NG Schemas

Oxygen XML Developer plugin provides a special type of editor for Relax NG schemas. This editor presents the usual text view of an XML document synchronized in real time with an outline view. The outline view has two display modes: the *standard outline* mode and the *components* mode.

Editing Relax NG Schema in the Master Files Context

Smaller interrelated modules that define a complex Relax NG Schema cannot be correctly edited or validated individually, due to their interdependency with other modules. For example, an element defined in a main schema document is not visible when you edit an included module. Oxygen XML Developer plugin provides the support for defining the main module (or modules), thus allowing you to edit any of the imported/included schema files in the context of the larger schema structure.

You cat set a main Relax NG document either using the *master files support from the Navigator view*, or using a validation scenario.

To set a main file using a validation scenario, add validation units that point to the main schemas. Oxygen XML Developer plugin warns you if the current module is not part of the dependencies graph computed for the main schema. In this case, it considers the current module as the main schema.

The advantages of editing in the context of main file include:

• Correct validation of a module in the context of a larger schema structure.

- **Content Completion Assistant** displays all the referable components valid in the current context. This include components defined in modules other than the currently edited one.
- The **Outline** displays the components collected from the entire schema structure;

Relax NG Schema Diagram

This section explains how to use the graphical diagram of a Relax NG schema.

Introduction to Relax NG Schema Diagram View

Oxygen XML Developer plugin provides a simple, expressive, and easy to read **Schema Diagram** view for Relax NG schemas.

With this new feature you can easily develop complex schemas, print them on multiple pages or save them as JPEG, PNG, or BMP images. It helps both schema authors in developing the schema and content authors who are using the schema to understand it.

Oxygen XML Developer plugin is the only XML editor to provide a side by side source and diagram presentation and have them real-time synchronized:

- The changes you make in the Editor are immediately visible in the Diagram (no background parsing).
- Changing the selected element in the diagram selects the underlying code in the source editor.

Full Model View

When you create a new schema document or open an existing one, the editor panel is divided in two sections: one containing the schema diagram and the second the source code. The **Diagram** view has two tabbed panes offering a **Full Model View** and a **Logical Model View**.

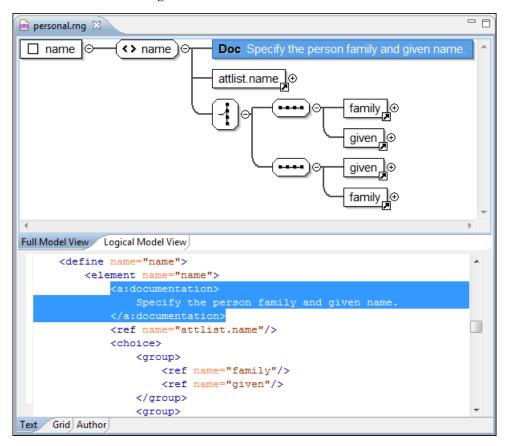

Figure 146: Relax NG Schema Editor - Full Model View

The following references can be expanded in place: patterns, includes, and external references. This expansion mechanism, coupled with the synchronization support, makes the schema navigation easy.

All the element and attribute names are editable: double-click any name to start editing it.

Symbols Used in the Schema Diagram

The Full Model View renders all the Relax NG Schema patterns with intuitive symbols:

- name define pattern with the name attribute set to the value shown inside the rectangle (in this example name).
- attlist.person define pattern with the combine attribute set to interleave and the name attribute set to the value shown inside the rectangle (in this example attlist.person).
- define pattern with the combine attribute set to choice and the name attribute set to the value shown inside the rectangle (in this example attlist.person).
- element pattern with the name attribute set to the value shown inside the rectangle (in this example name).
- - @ note attribute pattern with the name attribute set to the value shown inside de rectangle (in this case note).
- family ref pattern with the name attribute set to the value shown inside the rectangle (in this case family).
- 1... oneOrMore pattern.
- zeroOrMore pattern.
- - 0..1 E- optional pattern.
- choice pattern.
- value pattern, used for example inside a choice pattern.
- group pattern.
- pattern from the Relax NG Annotations namespace (http://relaxng.org/ns/compatibility/annotations/1.0) which is treated as a documentation element in a Relax NG schema.
- text pattern.
- empty pattern.

Logical Model View

The **Logical Model View** presents the compiled schema which is a single pattern. The patterns that form the element content are defined as top level patterns with generated names. These names are generated depending of the elements name class.

Figure 147: Logical Model View for a Relax NG Schema

Actions Available in the Schema Diagram View

When editing Relax NG schemas in Full Model View, the contextual menu offers the following actions:

Append child

Appends a child to the selected component.

Insert Before

Inserts a component before the selected component.

Insert After

Inserts a component after the selected component.

Edit attributes

Edits the attributes of the selected component.

Remove

Removes the selected component.

Show only the selected component

Depending on its state (selected/not selected), either the selected component or all the diagram components are shown.

Show Annotations

Depending on its state (selected/not selected), the documentation nodes are shown or hidden.

Auto expand to references

This option controls how the schema diagram is automatically expanded. If you select it and then edit a top-level element or you make a refresh, the diagram is expanded until it reaches referenced components. If this option is left unchecked, only the first level of the diagram is expanded, showing the top-level elements. For large schemas, the editor disables this option automatically.

Collapse Children

Collapses the children of the selected view.

Expand Children

Expands the children of the selected view.

Print Selection

Prints the selected view.

Save as Image

Saves the current selection as JPEG, BMP, SVG or PNG image.

C Refresh

Refreshes the schema diagram according to the changes in your code. They represent changes in your imported documents or changes that are not reflected automatically in the compiled schema).

If the schema is not valid, you see only an error message in the Logical Model View instead of the diagram.

Relax NG Outline View

The Relax NG **Outline** view presents a list with the patterns that appear in the diagram in both the **Full Model View** and **Logical Model View** cases. It allows a quick access to a component by name. By default it is displayed on screen, but if you closed it you can reopen it from **Window** > **Show View** > **Outline**.

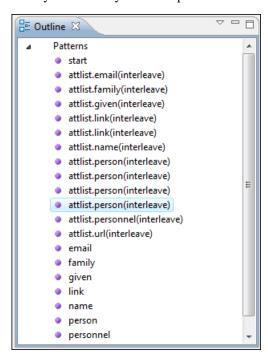

Figure 148: Relax NG Outline View

The tree shows the XML structure or the defined pattern (components) collected from the current document. By default, the **Outline** view presents the components.

When the **Show components** option is selected in the **View menu** on the **Outline** view action bar, the following option is available:

Show XML structure

Shows the XML structure of the current document in a tree-like manner.

The following actions are available in the **View menu** on the **Outline** view action bar when the **Show XML structure** option is selected:

Filter returns exact matches

The text filter of the **Outline** view returns only exact matches.

Selection update on cursor move

Allows a synchronization between **Outline** view and schema diagram. The selected view from the diagram will be also selected in the **Outline** view.

Show components

Shows the defined pattern collected from the current document.

Flat presentation mode of the filtered results

When active, the application flattens the filtered result elements to a single level.

Show comments and processing instructions

Show/hide comments and processing instructions in the Outline view.

Show element name

Show/hide element name.

T Show text

Show/hide additional text content for the displayed elements.

Show attributes

Show/hide attribute values for the displayed elements. The displayed attribute values can be changed from *the Outline preferences panel*.

Configure displayed attributes

Displays the XML Structured Outline preferences page.

The following contextual menu actions are also available in the **Outline** view when the **Show XML structure** option is selected in the **View menu**:

Append Child

Displays a list of elements that you can insert as children of the current element.

Insert Before

Displays a list of elements that you can insert as siblings of the current element, before the current element.

Insert After

Displays a list of elements that you can insert as siblings of the current element, after the current element.

Edit Attributes

Opens a dialog box that allows you to edit the attributes of the currently selected component.

→! Toggle Comment

Comments/uncomments the currently selected element.

Search references

Searches for the references of the currently selected component.

Search references in

Searches for the references of the currently selected component in the context of a scope that you define.

Component dependencies

Displays the dependencies of the currently selected component.

Rename Component in

Renames the currently selected component in the context of a scope that you define.

X Cu

Cuts the currently selected component.

Copies the currently selected component.

Delete

Deletes the currently selected component.

Expand All

Expands the structure of a component in the **Outline** view.

Collapse All

Collapses the structure of all the component in the **Outline** view.

The upper part of the **Outline** view contains a filter box that allows you to focus on the relevant components. Type a text fragment in the filter box and only the components that match it are presented. For advanced usage you can use wildcard characters (*, ?) and separate multiple patterns with commas.

Searching and Refactoring Actions in RNG Schemas

Search Actions

The following search actions can be applied on named *defines* and are available from the **Search** submenu in the contextual menu of the current editor:

- Search References Searches all references of the item found at current cursor position in the defined scope, if any. If a scope is defined, but the current edited resource is not part of the range of resources determined by this, a warning dialog box is displayed and you have the possibility to define another search scope.
- **Search References in** Searches all references of the item found at current cursor position in the file or files that you specify when define a scope in the **Search References** dialog box.
- Search Declarations Searches all declarations of the item found at current cursor position in the defined scope if any. If a scope is defined, but the current edited resource is not part of the range of resources determined by this, a warning dialog box will be displayed and you have the possibility to define another search scope.
- **Search Declarations in** Searches all declarations of the item found at current cursor position in the file or files that you specify when you define a scope for the search operation.
- Search Occurrences in File Searches all occurrences of the item at the cursor position in the currently edited file.

The following action is available from the **XSL** menu:

- Show Definition Moves the cursor to the definition of the current element in the Relax NG (full syntax) schema.
 - Note: You can also use the <u>Ctrl Single-Click (Command Single-Click on OS X)</u> shortcut on a reference to display its definition.

Refactoring Actions

The following refactoring actions can be applied on named *defines* and are available from the **Refactoring** submenu in the contextual menu of the current editor:

- Rename Component Allows you to rename the current component in-place. The component and all its references
 in the document are highlighted with a thin border and the changes you make to the component at the cursor position
 are updated in real time to all occurrences of the component. To exit in-place editing, press the <u>Esc</u> or <u>Enter</u> key on
 your keyboard.
- Rename Component in Opens the Rename component_type dialog box that allows you to rename the selected component by specifying the new component name and the files to be affected by the modification. If you click the Preview button, you can view the files affected by the Rename Component action.

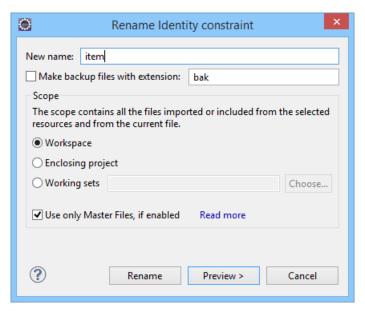

Figure 149: Rename Identity Constraint Dialog Box

RNG Resource Hierarchy/Dependencies View

The **Resource Hierarchy/Dependencies** view allows you to see the hierarchy/dependencies for a schema. To open this view, go to **Window** > **Show View** > **Other** > **Oxygen XML Developer plugin** > **Resource Hierarchy/Dependencies**.

If you want to see the hierarchy of a schema, select the desired schema in the project view and choose **Resource Hierarchy** from the contextual menu.

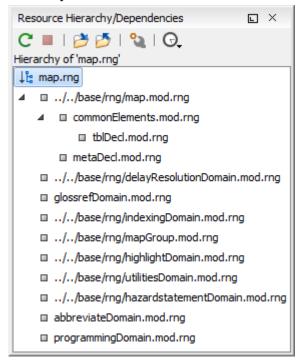

Figure 150: Resource Hierarchy/Dependencies View - hierarchy for map.rng

If you want to see the dependencies of a schema, select the desired schema in the project view and choose **Resource Dependencies** from the contextual menu.

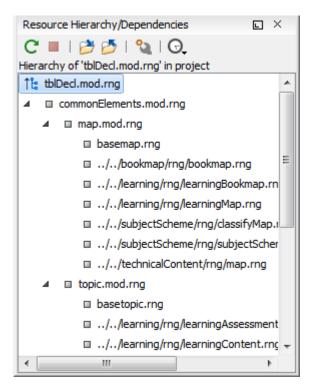

Figure 151: Resource Hierarchy/Dependencies View - Dependencies for tblDecl.mod.rng

The following actions are available in the **Resource Hierarchy/Dependencies** view:

C Refresh

Refreshes the Hierarchy/Dependencies structure.

Stop

Stops the hierarchy/dependencies computing.

Show Hierarchy

Allows you to choose a resource to compute the hierarchy structure.

Show Dependencies

Allows you to choose a resource to compute the dependencies structure.

Configure

Allows you to configure a scope to compute the dependencies structure. There is also an option for automatically using the defined scope for future operations.

O. History

Provides access to the list of previously computed dependencies. Use the ** Clear history button to remove all items from this list.

The contextual menu contains the following actions:

Open

Opens the resource. You can also double-click a resource in the Hierarchy/Dependencies structure to open it.

Copy location

Copies the location of the resource.

Move resource

Moves the selected resource.

Rename resource

Renames the selected resource.

Show Resource Hierarchy

Shows the hierarchy for the selected resource.

Show Resource Dependencies

Shows the dependencies for the selected resource.

k Add to Master Files

Adds the currently selected resource in the Master Files directory.

Expand All

Expands all the children of the selected resource from the Hierarchy/Dependencies structure.

Collapse All

Collapses all children of the selected resource from the Hierarchy/Dependencies structure.

Tip: When a recursive reference is encountered in the Hierarchy view, the reference is marked with a special icon \$.

Note: The Move resource or Rename resource actions give you the option to update the references to the resource.

Moving/Renaming RNG Resources

You are able to move and rename a resource presented in the **Resource/Hierarchy Dependencies** view, using the **Rename resource** and **Move resource** refactoring actions from the contextual menu.

When you select the Rename action in the contextual menu of the Resource/Hierarchy Dependencies view, the **Rename resource** dialog box is displayed. The following fields are available:

- **New name** Presents the current name of the edited resource and allows you to modify it.
- **Update references** Enable this option to update the references to the resource you are renaming.

When you select the Move action from the contextual menu of the Resource/Hierarchy Dependencies view, the Move **resource** dialog box is displayed. The following fields are available:

- **Destination** Presents the path to the current location of the resource you want to move and gives you the option to introduce a new location.
- New name Presents the current name of the moved resource and gives you the option to change it.
- **Update references of the moved resource(s)** Enable this option to update the references to the resource you are moving, in accordance with the new location and name.

If the Update references of the moved resource(s) option is enabled, a Preview option (which opens the Preview dialog box) is available for both actions. The **Preview** dialog box presents a list with the resources that are updated.

Note: Updating the references of a resource that is resolved through a catalog is not supported. Also, the update references operation is not supported if the path to the renamed or moved resource contains entities.

Component Dependencies View for RelaxNG Schemas

The Component Dependencies view allows you to see the dependencies for a selected Relax NG component. You can open the view from Window > Show View > Other > Oxygen XML Developer plugin > Component Dependencies.

If you want to see the dependencies of a RelaxNG component, select the desired component in the editor and choose the **Component Dependencies** action from the contextual menu. The action is available for all named defines.

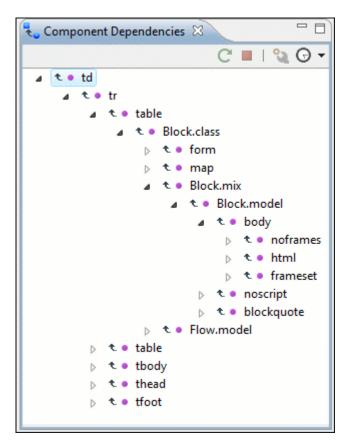

Figure 152: Component Dependencies View - Hierarchy for xhtml.rng

In the Component Dependencies view you have several actions in the toolbar:

C Refresh

Refreshes the dependencies structure.

Stop

Stops the dependencies computing.

Configure

Allows you to configure a search scope to compute the dependencies structure. You can decide to use automatically the defined scope for future operations by checking the corresponding checkbox.

O. History

Allows you to repeat a previous dependencies computation.

The following actions are available on the contextual menu:

Go to First Reference

Selects the first reference of the referenced component from the current selected component in the dependencies tree.

Go to Component

Shows the definition of the current selected component in the dependencies tree.

Tip: If a component contains multiple references to another components, a small table is displayed that contains all references. When a recursive reference is encountered, it is marked with a special icon \(\mathbb{G} \).

RNG Quick Assist Support

The *Quick Assist* support improves the development work flow, offering fast access to the most commonly used actions when you edit XML Schema documents.

The *Quick Assist* feature is activated automatically when the cursor is positioned over the name of a component. It is accessible via a yellow bulb help marker placed on the cursor line, in the line number stripe on the left side of the editor. Also, you can invoke the quick assist menu by using the **Ctrl + 1** keys (**Meta 1** on Mac OS X) keyboard shortcuts.

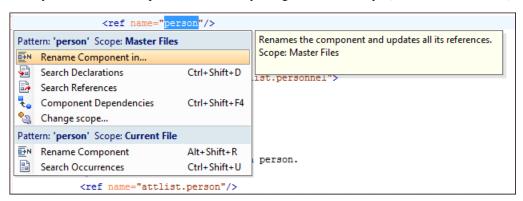

Figure 153: RNG Quick Assist Support

The quick assist support offers direct access to the following actions:

Rename Component in

Renames the component and all its dependencies.

Search Declarations

Searches the declaration of the component in a predefined scope. It is available only when the context represents a component name reference.

Search References

Searches all references of the component in a predefined scope.

Component Dependencies

Searches the component dependencies in a predefined scope.

Change Scope

Configures the scope that will be used for future search or refactor operations.

■ Rename Component

Allows you to rename the current component in-place.

Search Occurrences

Searches all occurrences of the component within the current file.

Configuring a Custom Datatype Library for a RELAX NG Schema

A RELAX NG schema can declare a custom datatype library for the values of elements found in XML document instances. The datatype library must be developed in Java and it must implement the interface *specified on the www.thaiopensource.com website*.

The jar file containing the custom library and any other dependent jar file must be added to the classpath of the application, that is the jar files must be added to the folder [OXYGEN_PLUGIN_DIR]/lib and a line library name="lib/custom-library.jar"/> must be added for each jar file to the file [OXYGEN_PLUGIN_DIR]/plugin.xml in the <runtime> element.

To load the custom library, restart the Eclipse platform.

Editing NVDL Schemas

Some complex XML documents are composed by combining elements and attributes from different namespaces. More, the schemas that define these namespaces are not even developed in the same schema language. In such cases, it is difficult to specify in the document all the schemas which must be taken into account for validation of the XML document or for content completion. An NVDL (Namespace Validation Definition Language) schema can be used. This schema allows the application to combine and interleave multiple schemas of different types (W3C XML Schema, RELAX NG schema, Schematron schema) in the same XML document.

Oxygen XML Developer plugin provides a special type of editor for NVDL schemas. This editor presents the usual text view of an XML document synchronized in real time with an outline view. The outline view has two display modes: the *standard outline* mode and the *components* mode.

NVDL Schema Diagram

This section explains how to use the graphical diagram of a NVDL schema.

Introduction to NVDL Schema Diagram View

Oxygen XML Developer plugin provides a simple, expressive, and easy to read Schema Diagram view for NVDL schemas.

With this new feature you can easily develop complex schemas, print them on multiple pages or save them as JPEG, PNG, and BMP images. It helps both schema authors in developing the schema and content authors that are using the schema to understand it.

Oxygen XML Developer plugin is the only XML Editor to provide a side by side source and diagram presentation and have them real-time synchronized:

- The changes you make in the Editor are immediately visible in the Diagram (no background parsing).
- Changing the selected element in the diagram, selects the underlying code in the source editor.

Full Model View

When you create a schema document or open an existing one, the editor panel is divided in two sections: one containing the schema diagram and the second the source code. The diagram view has two tabbed panes offering a Full Model View and a Logical Model View.

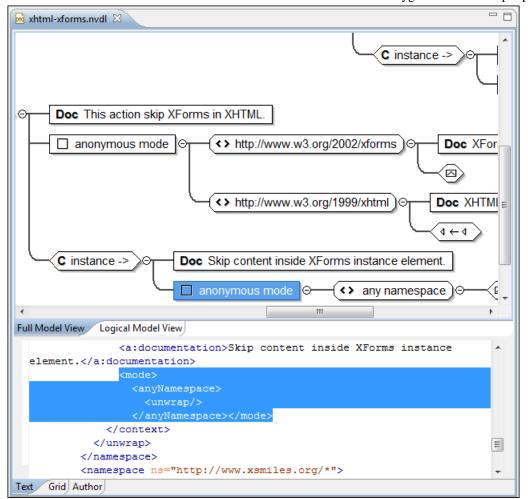

Figure 154: NVDL Schema Editor - Full Model View

The **Full Model View** renders all the NVDL elements with intuitive icons. This representation coupled with the synchronization support makes the schema navigation easy.

Double-click any diagram component in order to edit its properties.

Actions Available in the Diagram View

The contextual menu offers the following actions:

Show only the selected component

Depending on its state (selected/not selected), either the selected component or all the diagram components are shown.

Show Annotations

Depending on its state (selected/not selected), the documentation nodes are shown or hidden.

Auto expand to references

This option controls how the schema diagram is automatically expanded. For instance, if you select it and then edit a top-level element or you trigger a diagram refresh, the diagram will be expanded until it reaches the referenced components. If this option is left unchecked, only the first level of the diagram is expanded, showing the top-level elements. For large schemas, the editor disables this option automatically.

Collapse Children

Collapses the children of the selected view.

Expand Children

Expands the children of the selected view.

Print Selection

Prints the selected view.

Save as Image

Saves the current selection as image, in JPEG, BMP, SVG or PNG format.

Refresh

Refreshes the schema diagram according to the changes in your code (changes in your imported documents or those that are not reflected automatically in the compiled schema).

If the schema is not valid, you see only an error message in the Logical Model View instead of the diagram.

NVDL Outline View

The NVDL **Outline** view presents a list with the named or anonymous rules that appear in the diagram. It allows a quick access to a rule by name. It can be opened from the **Window** > **Show View** > **Other** > **Oxygen XML Developer plugin** > **Outline** menu.

Searching and Refactoring Actions in NVDL Schemas

Search Actions

The following search actions can be applied on name, useMode, and startMode attributes and are available from the **Search** submenu in the contextual menu of the current editor:

- Search References Searches all references of the item found at current cursor position in the defined scope, if any. If a scope is defined, but the current edited resource is not part of the range of resources determined by this, a warning dialog box is displayed and you have the possibility to define another search scope.
- **Search References in** Searches all references of the item found at current cursor position in the file or files that you specify when define a scope in the **Search References** dialog box.
- Search Declarations Searches all declarations of the item found at current cursor position in the defined scope if any. If a scope is defined, but the current edited resource is not part of the range of resources determined by this, a warning dialog box will be displayed and you have the possibility to define another search scope.
- **Search Declarations in** Searches all declarations of the item found at current cursor position in the file or files that you specify when you define a scope for the search operation.
- Search Occurrences in File Searches all occurrences of the item at the cursor position in the currently edited file.

The following action is available from the **XSL** menu:

• Show Definition - Moves the cursor to its definition in the schema used by NVDL in order to validate it.

Note: You can also use the $\underline{Ctrl\ Single-Click\ (Command\ Single-Click\ on\ OS\ X)}$ shortcut on a reference to display its definition.

Refactoring Actions

The following refactoring actions can be applied on name, useMode, and startMode attributes and are available from the **Refactoring** submenu in the contextual menu of the current editor:

• Rename Component - Allows you to rename the current component in-place. The component and all its references in the document are highlighted with a thin border and the changes you make to the component at the cursor position are updated in real time to all occurrences of the component. To exit in-place editing, press the <u>Esc</u> or <u>Enter</u> key on your keyboard.

• Rename Component in - Opens the Rename component_type dialog box that allows you to rename the selected component by specifying the new component name and the files to be affected by the modification. If you click the Preview button, you can view the files affected by the Rename Component action.

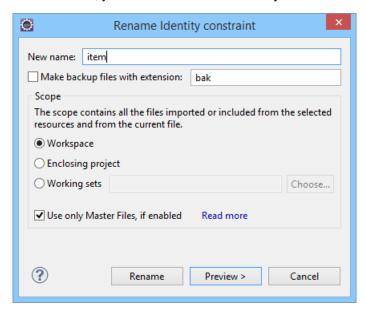

Figure 155: Rename Identity Constraint Dialog Box

Component Dependencies View for NVDL Schemas

The **Component Dependencies** view allows you to see the dependencies for a selected NVDL named mode. You can open the view from **Window** > **Show View** > **Other** > **<oXygen/> XML** > **Component Dependencies**.

If you want to see the dependencies of an NVDL mode, select the desired component in the editor and choose the **Component Dependencies** action from the contextual menu. The action is available for all named modes.

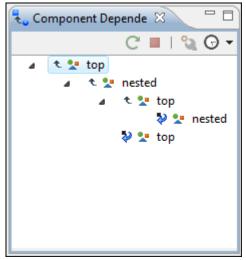

Figure 156: Component Dependencies View - Hierarchy for test.nvdl

In the **Component Dependencies** the following actions are available on the toolbar:

C Refresh

Refreshes the dependencies structure.

Allows you to stop the dependencies computing.

Configure

Allows you to configure a search scope to compute the dependencies structure. If you decide to set the application to use automatically the defined scope for future operations, select the corresponding checkbox.

O. History

Repeats a previous dependencies computation.

The following actions are available in the contextual menu:

Go to First Reference

Selects the first reference of the referenced component from the current selected component in the dependencies tree.

Go to Component

Shows the definition of the current selected component in the dependencies tree.

Tip: If a component contains multiple references to another component, a small table containing all references is displayed. When a recursive reference is encountered it is marked with a special icon §.

Editing JSON Documents

This section explains the features of the Oxygen XML Developer plugin JSON Editor and how to use them.

Editing JSON Documents in Text Mode

The **Text Mode** of the JSON editor provides the usual actions specific for a plain text editor: undo / redo, copy / paste, find / replace, drag and drop, and other editor actions like *validation* and *formatting and indenting (pretty print) document*.

You can use the two **Text** and **Grid** buttons available at the bottom of the editor panel if you want to switch between the editor **Text Mode** and **Grid Mode**.

Figure 157: JSON Editor Text Mode

Syntax Highlight in JSON Documents

Oxygen XML Developer plugin supports *Syntax Highlight* for JavaScript / JSON editors and provides default configurations for the JSON set of tokens. You can customize the foreground color, background color and the font style for each JSON token type.

Folding in JSON

In a large JSON document, the data enclosed in the '{' and '}' characters can be collapsed so that only the needed data remain in focus. The *folding features available for XML documents* are available in JSON documents.

Editing JSON Documents in Grid Mode

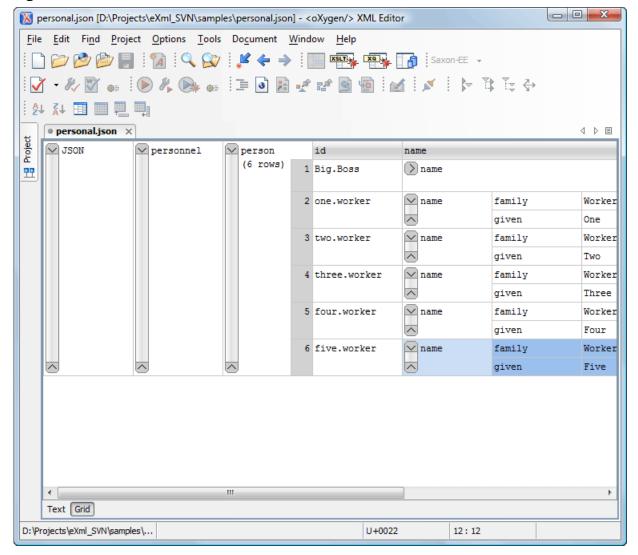

Figure 158: JSON Editor Grid Mode

Oxygen XML Developer plugin allows you to view and edit the JSON documents in the *Grid Mode*. The JSON is represented in **Grid** mode as a compound layout of nested tables in which the JSON data and structure can be easily manipulated with table-specific operations or drag and drop operations on the grid components. You can also use the following JSON-specific contextual actions:

Array

Useful when you want to convert a JSON *value* to *array*.

Insert value before

Inserts a value before the currently selected one.

Insert value after

Inserts a value after the currently selected one.

Append value as child

Appends a value as a child of the currently selected value.

You can *customize the JSON grid appearance* according to your needs. For instance you can change the font, the cell background, foreground, or even the colors from the table header gradients. The default width of the columns can also be changed.

JSON Outline View

The JSON **Outline** view displays the list of all the components of the JSON document you are editing. To enable the JSON **Outline** view, go to **Window** > **Show view** > **Outline**.

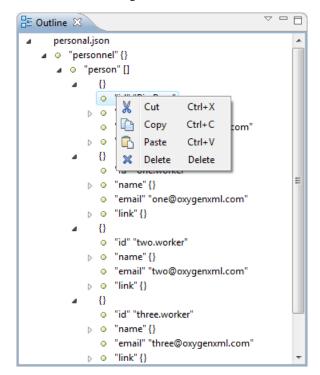

Figure 159: The JSON Outline View

The following actions are available in the contextual menu of the JSON **Outline** view:

- · & Cut
- · Copy
- 🗓 Paste
- × Delete

The **View menu** on the JSON **Outline** view action bar allows you to enable **Selection update on cursor move**. This option controls the synchronization between the **Outline** view and source the document. Oxygen XML Developer plugin synchronizes the selection in the **Outline** view with the cursor moves or the changes you make in the JSON editor. Selecting one of the components from the **Outline** view also selects the corresponding item in the source document.

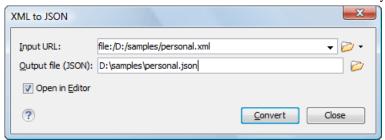

Validating JSON Documents

Oxygen XML Developer plugin includes a built-in JSON validator (based on the free JAVA source code available on www.json.org), integrated with the general validation support.

Convert XML to JSON

The steps for converting an XML document to JSON are the following:

 Select the XML to JSON action from the XML Tools menu. The XML to JSON dialog box is displayed:

- 2. Choose or enter the Input URL of the XML document.
- 3. Choose the Output file that will contain the conversion JSON result.
- **4.** Check the **Open in Editor** option to open the JSON result of the conversion in the Oxygen XML Developer plugin JSON Editor
- 5. Click the **OK** button.

The operation result will be a document containing the JSON conversion of the input XML URL.

Editing StratML Documents

Strategy Markup Language (StratML) is an XML vocabulary and schema for strategic plans. Oxygen XML Developer plugin supports StratML Part 1 (Strategic Plan) and StratML Part 2 (Performance Plans and Reports) and provides templates for the following documents:

- Strategic Plan (StratML Part 1)
- **Performance Plan** (StratML Part 2)
- **Performance Report** (StratML Part 2)

• Strategic Plan - (StratML Part 2)

You can view the components of a StratML document in the **Outline** view. Oxygen XML Developer plugin implements a default XML with XSLT transformation scenario for this document type, called StratML to HTML.

Editing XLIFF Documents

XLIFF (XML Localisation Interchange File Format) is an XML-based format that was designed to standardize the way multilingual data is passed between tools during a localization process. Oxygen XML Developer plugin provides the following support for editing XLIFF documents:

XLIFF Version 1.2 and 2.0 Support:

- New file templates for XLIFF documents.
- A default CSS file (xliff.css) used for rendering XLIFF content in **Author** mode is stored in [OXYGEN_DIR]/frameworks/xliff/css/.
- Validation and content completion support using local catalogs. The default catalog (catalog.xml) for version 1.2 is stored in [OXYGEN_DIR]/frameworks/xliff/xsd/1.2, and for version 2.0 in [OXYGEN_DIR]/frameworks/xliff/xsd/2.0.

XLIFF Version 2.0 Enhanced Support:

• Support for validating XLIFF 2.0 documents using modules. The default modules are stored in [OXYGEN_DIR]/frameworks/xliff/xsd/2.0/modules.

Editing JavaScript Documents

This section explains the features of the Oxygen XML Developer plugin JavaScript Editor and how you can use them.

JavaScript Editor Text Mode

Oxygen XML Developer plugin allows you to create and edit JavaScript files and assists you with useful features such as syntax highlight, content completion, and outline view. To enhance your editing experience, you can select entire blocks (parts of text delimited by brackets) by double-clicking somewhere inside the brackets.

```
12 √ function newPage (filename, overlay) {

Figure 160: JavaScript Editor Text Mode

The contextual menu of the **JavaScript** editor offers the following actions:

& Cut

Allows you to cut fragments of text from the editing area.

Allows you to copy fragments of text from the editing area.

Allows you to paste fragments of text in the editing area.

→! Toggle Comment

Allows you to comment a line or a fragment of the JavaScript document you are editing. This option inserts a single comment for the entire fragment you want to comment.

→! Toggle Line Comment

Allows you to comment a line or a fragment of the JavaScript document you are editing. This option inserts a comment for each line of the fragment you want to comment.

Go to Matching Bracket

Use this option to find the closing, or opening bracket, matching the bracket at the cursor position. When you select this option, Oxygen XML Developer plugin moves the cursor to the matching bracket, highlights its row, and decorates the initial bracket with a rectangle.

Note: A rectangle decorates the opening, or closing bracket which matches the current one at all times.

Source

Allows you to select one of the following actions:

To Lower Case

Converts the selection content to lower case characters.

To Upper Case

Converts the selection content to upper case characters.

Capitalize Lines

Converts to upper case the first character of every selected line.

Join and Normalize Lines

Joins all the rows you select to one row and normalizes the content.

Insert new line after

Inserts a new line after the line at the cursor position.

Modify all matches

Use this option to modify (in-place) all the occurrences of the selected content. When you use this option, a thin rectangle replaces the highlights and allows you to start editing. If matches with different letter cases are found, a dialog box is displayed that allows you select whether you want to modify only matches with the same letter case or all matches.

Open

Allows you to select one of the following actions:

- Open File at Cursor select this action to open the source of the file located at the cursor position
- **Open File at Cursor in System Application** select this action to open the source of the file located at the cursor position with the application that the system associates with the file

Compare

Select this option to open the **Diff Files** dialog box and compare the file you are editing with a file you choose in the dialog box.

Content Completion in JavaScript Files

When you edit a JavaScript document, the *Content Completion Assistant* presents you a list of the elements you can insert at the cursor position. For an enhanced assistance, JQuery methods are also presented. The following icons decorate the elements in the content completion list of proposals depending on their type:

- fo function

Figure 161: JavaScript Content Completion Assistant

The Content Completion Assistant collects:

- Method names from the current file and from the library files.
- Functions and variables defined in the current file.

If you edit the content of a function, the content completion list of proposals contains all the local variables defined in the current function, or in the functions that contain the current one.

JavaScript Outline View

Oxygen XML Developer plugin present a list of all the components of the JavaScript document you are editing in the **Outline** view. To open the **Outline** view, go to **Window** > **Show View** > **Outline**.

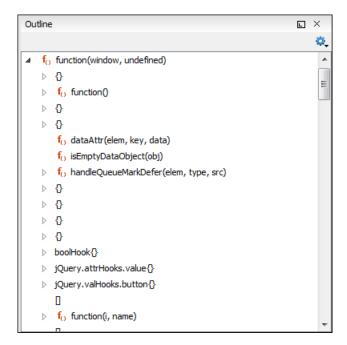

Figure 162: The JavaScript Outline View

The following icons decorate the elements in the **Outline** view depending on their type:

- fo function
- V variable
- a object
- • property
- f₀ method

The contextual menu of the JavaScript **Outline** view contains the usual **& Cut**, **\equiv Copy**, **\overline Copy**, **\overline Paste**, and **\times Delete** actions. From the settings menu, you can enable the Update selection on cursor move option to synchronize the **Outline** view with the editing area.

Validating JavaScript Files

You have the possibility to validate the JavaScript document you are editing. Oxygen XML Developer plugin uses the Mozilla Rhino library for validation. For more information about this library, go to http://www.mozilla.org/rhino/doc.html. The JavaScript validation process checks for errors in the syntax. Calling a function that is not defined is not treated as an error by the validation process. The interpreter discovers this error when executing the faulted line. Oxygen XML Developer plugin can validate a JavaScript document both on-request and automatically.

Editing XProc Scripts

An XProc script is edited as an XML document that is validated against a RELAX NG schema. If the script has an associated transformation scenario, then the XProc engine from the scenario is invoked as validating engine. The default engine for XProc scenarios is the Calabash engine which comes bundled with Oxygen XML Developer plugin version 17.1.

The content completion inside the element input/inline from the XProc namespace http://www.w3.org/ns/xproc offers elements from the following schemas depending both on the port attribute and the parent of the input element. When invoking the content completion inside the XProc element inline, the Content Completion Assistant's proposals list is populated as follows:

• If the value of the port attribute is stylesheet and the xslt element is the parent of the input elements, the **Content Completion Assistant** offers XSLT elements.

- If the value of the port attribute is schema and the validate-with-relax-ng element is the parent of the input element, the **Content Completion Assistant** offers RELAX NG schema elements.
- If the value of the port attribute is schema and the validate-with-xml-schema element is the parent of the input element, the **Content Completion Assistant** offers XML Schema schema elements.
- If the value of the port attribute is schema and the validate-with-schematron element is the parent of the input element, the **Content Completion Assistant** offers either ISO Schematron elements or Schematron 1.5 schema elements.
- If the above cases do not apply, then the **Content Completion Assistant** offers elements from all the schemas from the above cases.

The XProc editor assists you in writing XPath expressions by offering a **Content Completion Assistant** and dedicated coloring schemes. To customize the coloring schemes, *open the Preferences dialog box* and go to **Editor** > **Syntax Highlight**.

Editing Schematron Schemas

Schematron is a simple and powerful Structural Schema Language for making assertions about patterns found in XML documents. It relies almost entirely on XPath query patterns for defining rules and checks. Schematron validation rules allow you to specify a meaningful error message. This error message is provided to you if an error is encountered during the validation stage.

The Skeleton XSLT processor is used for validation and conforms with ISO Schematron or Schematron 1.5. It allows you to validate XML documents against Schematron schemas or against combined RELAX NG / W3C XML Schema and Schematron.

Oxygen XML Developer plugin assists you in editing Schematron documents with schema-based content completion, syntax highlight, search and refactor actions, and dedicated icons for the **Outline** view. You can create a new Schematron schema using one of the Schematron templates available in the New Document wizard.

You can specify the query language binding to be used in the Schematron schema by doing the following:

- For embedded ISO schematron, *open the Preferences dialog box*, go to **XML** > **XML** Parser > **Schematron**, and select it in the **Embedded rules query language binding** option.
- For standalone ISO Schematron, specify the version by setting the query language to be used in a queryBinding attribute on the schema root element. For more information see the *Query Language Binding section of the Schematron specifications*.

• For Schematron 1.5 (standalone and embedded), *open the Preferences dialog box*, go to XML > XML Parser > Schematron, and select the version in the XPath Version option.

The Schematron editor renders the XPath expressions with dedicated coloring schemes. To customize the coloring schemes, *open the Preferences dialog box* and go to **Editor** > **Syntax Highlight**.

Note: When you create a Schematron document, Oxygen XML Developer plugin provides a built-in transformation scenario. You are able to use this scenario to obtain the XSLT style-sheet corresponding to the Schematron schema. You can apply this XSLT stylesheet to XML documents to obtain the Schematron validation results.

Validate an XML Document Against Schematron

To validate an XML document against a Schematron schema, select the Validate action from the Validation toolbar drop-down menu, or the XML menu, or from the Validate menu when invoking the contextual menu in the Navigator view.

If you would like to add a persistence association between your Schematron rules and the current edited XML document, use the **Associate Schema* action from the **Document** > Schema* menu or the **Document** toolbar. A custom processing instruction is added into the document and the validation process will take into account the Schematron rules:

```
PI Added by the Associate Schema Action
```

The possible errors that might occur during the validation process are presented in the **Problems** tab at the bottom area of the Oxygen XML Developer plugin window. Each error is flagged with a severity level that can be one of *warning*, *error*, *fatal* or *info*.

To set a severity level, Oxygen XML Developer plugin looks for the following information:

- The role attribute, which can have one of the following values:
 - warn or warning, to set the severity level to warning
 - error, to set the severity level to error
 - fatal, to set the severity level to fatal
 - info or information, to set the severity level to info
- The start of the message, after trimming leading white-spaces. Oxygen XML Developer plugin looks to match the following exact string of characters (case sensitive):
 - Warning:, to set the severity level to warning
 - Error:, to set the severity level to *error*
 - Fatal:, to set the severity level to *fatal*
 - Info:, to set the severity level to *info*
 - Note: Displayed message does not contain the matched prefix.
- If none of the previous rules match, Oxygen XML Developer plugin sets the severity level to error.

Validating Schematron Documents

By default, a Schematron schema is validated as you type. To change this, *open the Preferences dialog box*, go to **Editor** > **Document Checking**, and disable the **Enable automatic validation** option.

To validate your Schematron document manually, select the **Validate** action from the **Validation** toolbar drop-down menu or the **XML** menu. When Oxygen XML Developer plugin validates a Schematron schema, it expands

all the included modules so the entire schema hierarchy is validated. The validation problems are highlighted directly in the editor, making it easy to locate and fix any issues.

Oxygen XML Developer plugin offers an error management mechanism capable of pinpointing errors in XPath expressions and in the included schema modules.

Content Completion in Schematron Documents

Oxygen XML Developer plugin helps you edit a Schematron schema, offering, through the Content Completion Assistant, items that are valid at the cursor position. When you edit the value of an attribute that refers a component, the proposed components are collected from the entire schema hierarchy. For example, if the editing context is phase/active/@pattern, the Content Completion Assistant proposes all the defined patterns.

Note: For Schematron resources, the Content Completion Assistant collects its components starting from the master files. The master files can be defined in the project or in the associated validation scenario. For further details about the **Master Files** support go to *Defining Master Files at Project Level*.

If the editing context is an attribute value that is an XPath expression (like assert/@test or report/@test), the Content Completion Assistant offers the names of XPath functions, the XPath axes, and user-defined variables.

The **Content Completion Assistant** displays XSLT 1.0 functions and optionally XSLT 2.0/3.0 functions in the attributes *path*, *select*, *context*, *subject*, *test* depending on *the Schematron options* that are set in Preferences pages. If the Saxon 6.5.5 namespace (xmlns:saxon="http://icl.com/saxon") or the Saxon 9.6.0.7 namespace is declared in the Schematron schema (xmlns:saxon="http://saxon.sf.net/") the content completion also displays the XSLT Saxon extension functions as in the following figure:

Figure 164: XSLT extension functions in Schematron schemas documents

The **Content Completion Assistant** also includes *code templates that can be used to quickly insert code fragments* into Schematron documents.

RELAX NG/XML Schema with Embedded Schematron Rules

Schematron rules can be embedded into an XML Schema through annotations (using the appinfo element), or in any element on any level of a RELAX NG Schema (taking into account that the RELAX NG validator ignores all elements that are not in the RELAX NG namespace).

Oxygen XML Developer plugin accepts such documents as Schematron validation schemas and it is able to extract and use the embedded rules. To validate an XML document with both RELAX NG schema and its embedded Schematron rules, you need to associate the document with both schemas. For example:

```
<?xml-model href="percent.rng" type="application/xml"
schematypens="http://relaxng.org/ns/structure/1.0"?>
<?xml-model href="percent.rng" type="application/xml"
schematypens="http://purl.oclc.org/dsdl/schematron"?>
```

The second association validates your document with Schematron rules extracted from the RELAX NG Schema. Similarly, you can specify an XML Schema having the embedded Schematron rules.

<?xml-model href="percent.xsd" type="application/xml" schematypens="http://purl.oclc.org/dsdl/schematron"?>

Note: When you work with XML Schema or Relax NG documents that have embedded Schematron rules Oxygen XML Developer plugin provides two built-in validation scenarios: Validate XML Schema with embedded Schematron for XML schema, and Validate Relax NG with embedded Schematron for Relax NG. You can use one of these scenarios to validate the embedded Schematron rules.

Editing Schematron Schema in the Master Files Context

Smaller interrelated modules that define a complex Schematron cannot be correctly edited or validated individually, due to their interdependency with other modules. For example, a diagnostic defined in a main schema document is not visible when you edit an included module. Oxygen XML Developer plugin provides the support for defining the main module (or modules), thus allowing you to edit any of the imported/included schema files in the context of the larger schema structure.

You cat set a main Schematron document either using the *master files support from the Navigator view*, or using a validation scenario.

To set a main file using a validation scenario, add validation units that point to the main schemas. Oxygen XML Developer plugin warns you if the current module is not part of the dependencies graph computed for the main schema. In this case, it considers the current module as the main schema.

The advantages of editing in the context of main file include:

- Correct validation of a module in the context of a larger schema structure.
- Content Completion Assistant displays all the referable components valid in the current context. This include components defined in modules other than the currently edited one.

Schematron Outline View

The Schematron **Outline** view presents a list of components in a tree-like structure. It allows a quick access to a component by name. By default it is displayed on screen, but if you closed it you can reopen it from **Window** > **Show View** > **Outline**.

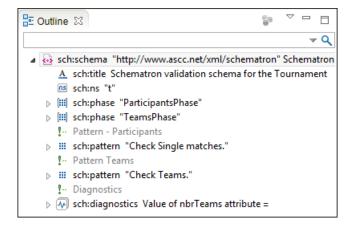

Figure 165: Schematron Outline View

The following actions are available in the **View menu** on the **Outline** view action bar:

Filter returns exact matches

The text filter of the **Outline** view returns only exact matches.

Selection update on cursor move

Controls the synchronization between **Outline** view and source document. The selection in the **Outline** view can be synchronized with the cursor moves or the changes in the editor. Selecting one of the components from the **Outline** view also selects the corresponding item in the source document.

Flat presentation mode of the filtered results

When active, the application flattens the filtered result elements to a single level.

Show comments and processing instructions

Show/hide comments and processing instructions in the **Outline** view.

Show element name

Show/hide element name.

T Show text

Show/hide additional text content for the displayed elements.

Show attributes

Show/hide attribute values for the displayed elements. The displayed attribute values can be changed from *the Outline preferences panel*.

Configure displayed attributes

Displays the XML Structured Outline preferences page.

The following contextual menu actions are also available in the **Outline** view:

Append Child

Displays a list of elements that you can insert as children of the current element.

Insert Before

Displays a list of elements that you can insert as siblings of the current element, before the current element.

Insert After

Displays a list of elements that you can insert as siblings of the current element, after the current element.

Edit Attributes

Opens a dialog box that allows you to edit the attributes of the currently selected component.

→! Toggle Comment

Comments/uncomments the currently selected element.

& Cut

Cuts the currently selected component.

Copy

Copies the currently selected component.

X Delete

Deletes the currently selected component.

Expand All

Expands the structure of a component in the **Outline** view.

Collapse All

Collapses the structure of all the component in the **Outline** view.

The upper part of the **Outline** view contains a filter box that allows you to focus on the relevant components. Type a text fragment in the filter box and only the components that match it are presented. For advanced usage you can use wildcard characters (*, ?) and separate multiple patterns with commas.

Schematron Resource Hierarchy/Dependencies View

The **Resource Hierarchy/Dependencies** view allows you to see the hierarchy/dependencies for a Schematron schema. To open this view, go to **Window** > **Show View** > **Other** > **Oxygen XML Developer plugin** > **Resource Hierarchy/Dependencies**.

If you want to see the hierarchy of a schema, select the desired schema in the project view and choose **Resource Hierarchy** from the contextual menu.

If you want to see the dependencies of a schema, select the desired schema in the project view and choose **Resource Dependencies** from the contextual menu.

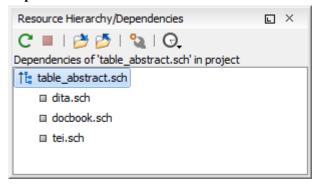

Figure 167: Resource Hierarchy/Dependencies View - Dependencies for table_abstract.sch

The following actions are available in the **Resource Hierarchy/Dependencies** view:

C Refresh

Refreshes the Hierarchy/Dependencies structure.

■ Stop

Stops the hierarchy/dependencies computing.

Show Hierarchy

Allows you to choose a resource to compute the hierarchy structure.

Show Dependencies

Allows you to choose a resource to compute the dependencies structure.

a Configure

Allows you to configure a scope to compute the dependencies structure. There is also an option for automatically using the defined scope for future operations.

O. History

Provides access to the list of previously computed dependencies. Use the * Clear history button to remove all items from this list.

The contextual menu contains the following actions:

Open

Opens the resource. You can also double-click a resource in the Hierarchy/Dependencies structure to open it.

Copy location

Copies the location of the resource.

Move resource

Moves the selected resource.

Rename resource

Renames the selected resource.

Show Resource Hierarchy

Shows the hierarchy for the selected resource.

Show Resource Dependencies

Shows the dependencies for the selected resource.

Add to Master Files

Adds the currently selected resource in the Master Files directory.

Expand All

Expands all the children of the selected resource from the Hierarchy/Dependencies structure.

Collapse All

Collapses all children of the selected resource from the Hierarchy/Dependencies structure.

Tip: When a recursive reference is encountered in the Hierarchy view, the reference is marked with a special icon \$.

Note: The Move resource or Rename resource actions give you the option to update the references to the resource.

Moving/Renaming Schematron Resources

You are able to move and rename a resource presented in the **Resource/Hierarchy Dependencies** view, using the **Rename resource** and **Move resource** refactoring actions from the contextual menu.

When you select the Rename action in the contextual menu of the Resource/Hierarchy Dependencies view, the Rename resource dialog box is displayed. The following fields are available:

- New name Presents the current name of the edited resource and allows you to modify it.
- **Update references** Enable this option to update the references to the resource you are renaming.

When you select the Move action from the contextual menu of the Resource/Hierarchy Dependencies view, the Move **resource** dialog box is displayed. The following fields are available:

- **Destination** Presents the path to the current location of the resource you want to move and gives you the option to introduce a new location.
- New name Presents the current name of the moved resource and gives you the option to change it.
- **Update references of the moved resource(s)** Enable this option to update the references to the resource you are moving, in accordance with the new location and name.

If the Update references of the moved resource(s) option is enabled, a Preview option (which opens the Preview dialog box) is available for both actions. The **Preview** dialog box presents a list with the resources that are updated.

Highlight Component Occurrences in Schematron Documents

When you position your mouse cursor over a component in a Schematron document, Oxygen XML Developer plugin searches for the component declaration and all its references and highlights them automatically.

Customizable colors are used: one for the component definition and another one for component references. Occurrences are displayed until another component is selected.

To change the default behavior of **Highlight Component Occurrences**, *open the Preferences dialog box* and go to **Editor** > **Mark Occurrences**. You can also trigger a search using the **Search Occurrences in File Ctrl Shift U (Meta Shift U on OS X)** action from contextual menu. Matches are displayed in separate tabs of the **Results** view.

Searching and Refactoring Operations in Schematron Documents

Search Actions

The following search actions can be applied on pattern, phase, or diagnostic types and are available from the **Search** submenu in the contextual menu of the current editor:

- Search References Searches all references of the item found at current cursor position in the defined scope, if any. If a scope is defined, but the current edited resource is not part of the range of resources determined by this, a warning dialog box is displayed and you have the possibility to define another search scope.
- **Search References in** Searches all references of the item found at current cursor position in the file or files that you specify when define a scope in the **Search References** dialog box.
- Search Declarations Searches all declarations of the item found at current cursor position in the defined scope if any. If a scope is defined, but the current edited resource is not part of the range of resources determined by this, a warning dialog box will be displayed and you have the possibility to define another search scope.
- **Search Declarations in** Searches all declarations of the item found at current cursor position in the file or files that you specify when you define a scope for the search operation.
- Search Occurrences in File Searches all occurrences of the item at the cursor position in the currently edited file.

Refactoring Actions

The following refactoring actions can be applied on pattern, phase, or diagnostic types and are available from the **Refactoring** submenu in the contextual menu of the current editor:

- **Rename Component** Allows you to rename the current component in-place. The component and all its references in the document are highlighted with a thin border and the changes you make to the component at the cursor position are updated in real time to all occurrences of the component. To exit in-place editing, press the **Esc** or **Enter** key on your keyboard.
- Rename Component in Opens the Rename *component_type* dialog box that allows you to rename the selected component by specifying the new component name and the files to be affected by the modification. If you click the **Preview** button, you can view the files affected by the **Rename Component** action.

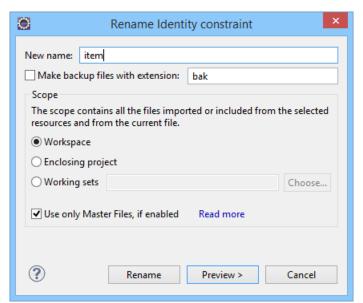

Figure 168: Rename Identity Constraint Dialog Box

Searching and Refactoring Operations Scope in Schematron Documents

The *scope* is a collection of documents that define the context of a search and refactor operation. To control it you can use the **Change scope** operation, available in the Quick Fix action set or on the **Resource Hierarchy/Dependency View** toolbar. You can restrict the scope to the current project or to one or multiple working sets. The **Use only Master Files, if enabled** check-box allows you to restrict the scope of the search and refactor operations to the resources from the **Master Files** directory. Click **read more** for details about the *Master Files support*.

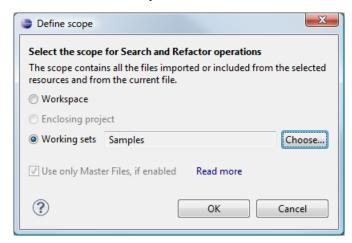

Figure 169: Define Scope Dialog Box

The scope you define is applied to all future search and refactor operations until you modify it. Contextual menu actions allow you to add or delete files, folders, and other resources to the working set structure.

Quick Assist Support in Schematron Documents

The *Quick Assist* feature is activated automatically when the cursor is positioned over the name of a component. It is accessible via a yellow bulb help marker placed on the cursor line, in the line number stripe on the left side of the editor. Also, you can invoke the quick assist menu by using the **Ctrl** + 1 keys (**Meta 1** on Mac OS X) keyboard shortcuts.

Figure 170: Schematron Quick Assist Support

The quick assist support offers direct access to the following actions:

EN Rename Component in

Renames the component and all its dependencies.

Search Declarations

Searches the declaration of the component in a predefined scope. It is available only when the context represents a component name reference.

Search References

Searches all references of the component in a predefined scope.

Component Dependencies

Searches the component dependencies in a predefined scope.

Change Scope

Configures the scope that will be used for future search or refactor operations.

EN Rename Component

Allows you to rename the current component in-place.

Search Occurrences

Searches all occurrences of the component within the current file.

Editing Schematron Quick Fixes

Oxygen XML Developer plugin provides support for editing the *Schematron Quick Fixes*. You can define a library of quick fixes by editing them directly in the current Schematron file or in a separate file. Oxygen XML Developer plugin assists you in editing Schematron Quick Fixes with schema-based content completion, syntax highlighting, and validation as you type.

This section includes details about the Schematron Quick Fixes feature and how to customize them.

Customizing Schematron Quick Fixes

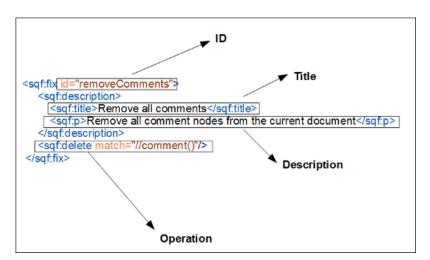

You can customize Schematron Quick Fixes by editing them directly in the current Schematron file or in a separate file. The Schematron Quick Fixes are an extension of the Schematron language and they allow you to define fixes for Schematron error messages. You can refer the quick fixes from the assert or report elements in the values of the sqf:fix attributes.

Defining a Schematron Quick Fix

The basics of a Schematron Quick Fix is defined by an ID, name, description, and the operations to be executed.

- **ID** Defined by the id attribute from the fix element and must be unique in the current context. It is used to refer the quick fix from a report or assert element.
- Name The name of the quick fix is defined by the title element.

- **Description** Defined by the text in the paragraphs (p) of the description element.
- **Operations** The following types of operations are supported:
 - <sqf:add> To add a new node or fragment in the document.
 - <sqf:delete> To remove a node from the document.
 - <sqf:replace> To replace a node with another node or fragment.
 - <sqf:stringReplace> To replace text content with other text or a fragment.

The assertion message that generates the quick fix is added as the description of the problem to be fixed. The title is presented as the name of the quick fix. The content of the paragraphs (p) within the description element are presented in the tooltip message when the quick fix is selected.

Schematron Quick Fix Operations

Add

The <sqf:add> element allows you to add a node to the instance. An anchor node is required to select the position for the new node. The anchor node can be selected by the match attribute. Otherwise, it is selected by the context attribute of the rule.

The target attribute defines the name of the node to be added. It is required if the value of the node-type attribute is set to anything other than "comment".

The <sqf:add> element has a position attribute and it determines the position relative to the anchor node. The new node could be specified as the first child of the anchor node, the last child of the anchor node, before the anchor node, or after the anchor node (first-child is the default value). If you want to add an attribute to the anchor node, do not use the position attribute.

Note: If you insert an element and its content is empty, Oxygen XML Developer plugin will insert the required element content.

An Example of the <sqf:add> Element:

Specific Add Operations:

- **Insert Element** To insert an element, use the <sqf:add> element, set the value of the node-type to "element", and specify the element *QName* with the target attribute. If the element has a prefix, it must be defined in the Schematron using a namespace declaration (<ns uri="namespace" prefix="prefix"/>).
- **Insert Attribute** To insert an attribute, use the <sqf:add> element, set the value of the node-type to "attribute", and specify the attribute *QName* with the target attribute. If the attribute has a prefix, it must be defined in the Schematron using a namespace declaration (<ns uri="namespace" prefix="prefix"/>).
- **Insert Fragment** If the node-type is not specified, the <sqf:add> element will insert an XML fragment. The XML fragment must be well formed. You can specify the fragment in the add element or by using the select attribute.
- **Insert Comment** To insert a comment, use the <sqf:add> element and set the value of the node-type to "comment".
- Insert Processing Instruction To insert a processing instruction, use the <sqf:add> element, set the value
 of the node-type to "pi" or "processing-instruction", and specify the name of the processing instruction in
 the target attribute.

Delete

The <sqf:delete> element allows you to remove any type of node (such as elements, attributes, text, comments, or processing instructions). To specify nodes for deletion the <sqf:delete> element can include a match attribute that is an XPath expression (the default value is .). If the match attribute is not included, it deletes the context node of the Schematron rule.

An Example of the <sqf:delete> Element:

Replace

The <sqf:replace> element allows you to replace nodes. Similar to the <sqf:delete> element, it can include a match attribute. Otherwise, it replaces the context node of the rule. The <sqf:replace> element has three tasks. It identifies the nodes to be replaced, defines the replacing nodes, and defines their content.

An Example of the <sqf:replace> Element:

Other Attributes for Replace Operations:

- **node-type** Determines the type of the replacing node. The permitted values include:
 - keep Keeps the node type of the node to be replaced.
 - element Replaces the node with an element.

- attribute Replaces the node with an attribute.
- pi Replaces the node with a processing instruction.
- comment Replaces the node with a comment.
- **target** By using a *QName* it gives the replacing node a name. This is necessary when the value of the node-type attribute is anything other than "comment".
- **select** Allows you to choose the content of the replacing nodes. You can use XPath expressions with the select attribute. If the select attribute is not specified then the content of the <sqf:replace> element is used instead.

String Replace

The <sqf:stringReplace> element is different from the others. It can be used to find a sub-string of text content and replace it with nodes or other strings.

Attributes for the String Replace Operation:

- match Allows you to select text nodes that contain the sub-strings you want to replace.
- **select** Allows you to select the replacing fragment, in case you do not want to set it in the content of the stringReplace element.
- regex Matches the sub-strings using a regular expression.
 - 류

Note: Regular expressions in the <sqf:stringReplace> element always has the *dot matches all* flag set to "true". Therefore, the line terminator will also be matched by the regular expression.

Attention: The context of the content within the <sqf:stringReplace> element is set to the whole text node, rather than the current sub-string.

An Example of the <sqf:stringReplace> Element:

Formatting and Indenting Inserted Content

The content that is inserted by the **Add**, **Replace**, or **String Replace** operations is automatically indented unless you set the value of the xml:space attribute to preserve on the operation element. There are several methods available to format the content that is inserted:

• **xsl:text** - You can use an xsl:text element to format the inserted content and keep the automatic indentation, as in the following example:

• xml:space - Use the xml:space attribute and set its value to preserve to format the content and specify the spacing between elements, as in the following example:

```
<sqf:add node-type="element" target="codeblock" xml:space="preserve">
   /* a long sample program */
   Do forever
   Say "Hello, World"
   End</sqf:add>
```

The Use-When Condition

To restrict a quick fix or a specific operation to only be available if certain conditions are met, the use-when attribute can be included in the <sqf:fix> element or any of the SQF operation elements. The condition of the use-when attribute is an XPath expression and the fix or operation will be performed only if the condition is satisfied. In the following example, the use-when condition is applied to the <sqf:fix> element:

Executing Schematron Quick Fixes in Documents Other than the Current One

You can apply Schematron Quick Fixes over the nodes from referred documents (referred using XInclude or external entities), and you can access them as nodes in your current document.

Also, you can apply the quick fixes over other documents using the doc() function in the value of the match attribute. For example, you can add a new key in the keylist.xml file using the following operation:

```
<sqf:add match="doc('keylist.xml')/KeyList" target="Key" node-type="element" select="Key2">
```

Additional Elements Supported in the Schematron Quick Fixes

<sqf:call-fix>

This element calls another quick fix within a quick fix. The called quick fix must be defined globally or in the same Schematron rule as the calling quick fix. A calling quick fix adopts the activity elements of the called quick fix and should not include other activity elements. You can also specify which parameters are sent by using the <sqf:with-param> child element.

<sqf:group>

Allows you to group multiple quick fixes and refer them from an assert or report element.

<sqf:fixes>

Is defined globally and contains global fixes and groups of fixes.

<sqf:keep>

Used to copy the selected nodes that are specified by the select attribute.

Note: In Oxygen XML Developer plugin the copied nodes cannot be manipulated by the current or other activity elements.

<sqf:param>

Defines a parameter for a quick fix. If the parameter is defined as abstract then the type and default value should not be specified and the fix can be called from an abstract pattern that defines this parameter.

<sqf:user-entry>

Allows you to specify a value that will be inserted after the user selects the quick fix. If multiple user-entry elements are defined, Oxygen XML Developer plugin will display a dialog box for each one, in which the user can insert values.

Other SQF Notes

Note: The sqf:defaultFix attribute is ignored in Oxygen XML Developer plugin.

For more details on editing Schematron Quick Fixes, go to: Schematron Quick Fix Specifications

Validating Schematron Quick Fixes

By default, Schematron Quick Fixes are validated as you edit them within the Schematron file or while editing them in a separate file. To change this, *open the Preferences dialog box*, go to **Editor** > **Document Checking**, and disable the **Enable automatic validation** option.

To validate Schematron Quick Fixes manually, select the **Validate** action from the **Validation** toolbar drop-down menu or the **XML** menu. The validation problems are highlighted directly in the editor, making it easy to locate and fix any issues.

Content Completion in SQF

Oxygen XML Developer plugin helps you edit Schematron Quick Fixes embedded in a Schematron document, offering, through the Content Completion Assistant, items that are valid at the cursor position. When you edit the value of an attribute that references a quick fix *id*, the ids are collected from the entire definition scope. For example, if the editing context is assert/@sqf:fix, the Content Completion Assistant proposes all fixes defined locally and globally.

If the editing context is an attribute value that is an XPath expression (such as sqf:add/@match or replace/@select), the Content Completion Assistant offers the names of XPath functions, the XPath axes, and user-defined variables and parameters.

The **Content Completion Assistant** displays XSLT 1.0 functions (and optionally XSLT 2.0 / 3.0 functions) in the attributes *path*, *select*, *context*, *subject*, and *test*, depending on *the Schematron options* that are set in Preferences pages. If the Saxon 6.5.5 namespace (xmlns:saxon="http://icl.com/saxon") or the Saxon 9.6.0.7 namespace is declared in the Schematron schema (xmlns:saxon="http://saxon.sf.net/") the content completion also displays the XSLT Saxon extension functions.

Highlight Quick Fix Occurrences in SQF

When you position your mouse cursor over a quick fix id in a Schematron document, Oxygen XML Developer plugin searches for the quick fix declaration and all its references and highlights them automatically.

Customizable colors are used: one for the quick fix definition and another one for its references. Occurrences are displayed until another quick fix is selected.

To change the default behavior of **Highlight Component Occurrences**, *open the Preferences dialog box* and go to **Editor** > **Mark Occurrences**. You can also trigger a search using the **Search** > **Search Occurrences in File** (<u>Ctrl</u> <u>Shift U (Meta Shift U on OS X)</u>) action from contextual menu. Matches are displayed in separate tabs of the **Results** view.

Searching and Refactoring Operations in SQF

Search Actions

The following search actions can be applied on quick fix ids and are available from the **Search** submenu in the contextual menu of the current editor:

- Search References Searches all references of the item found at current cursor position in the defined scope, if any. If a scope is defined, but the current edited resource is not part of the range of resources determined by this, a warning dialog box is displayed and you have the possibility to define another search scope.
- **Search References in** Searches all references of the item found at current cursor position in the file or files that you specify when define a scope in the **Search References** dialog box.
- Search Declarations Searches all declarations of the item found at current cursor position in the defined scope if any. If a scope is defined, but the current edited resource is not part of the range of resources determined by this, a warning dialog box will be displayed and you have the possibility to define another search scope.
- **Search Declarations in** Searches all declarations of the item found at current cursor position in the file or files that you specify when you define a scope for the search operation.
- Search Occurrences in File Searches all occurrences of the item at the cursor position in the currently edited file.

Refactoring Actions

The following refactoring actions can be applied on quick fix ids and are available from the **Refactoring** submenu in the contextual menu of the current editor:

- Rename Component Allows you to rename the current component in-place. The component and all its references
 in the document are highlighted with a thin border and the changes you make to the component at the cursor position
 are updated in real time to all occurrences of the component. To exit in-place editing, press the <u>Esc</u> or <u>Enter</u> key on
 your keyboard.
- Rename Component in Opens the Rename component_type dialog box that allows you to rename the selected component by specifying the new component name and the files to be affected by the modification. If you click the Preview button, you can view the files affected by the Rename Component action.

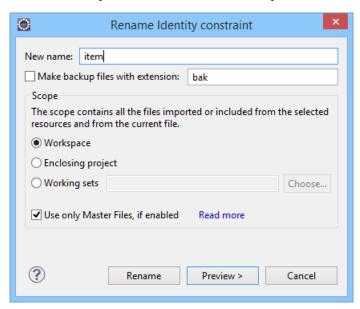

Figure 171: Rename Identity Constraint Dialog Box

Embed Schematron Quick Fixes in Relax NG or XML Schema

Schematron Quick Fixes can be embedded into a Relax NG or XML Schema within the Schematron rules from annotations (using the appinfo element), or in any Schematron rule of a RELAX NG Schema.

Oxygen XML Developer plugin is able to extract and use the embedded Schematron Quick Fixes. To make the Schematron Quick Fixes available, validate the document with both the RELAX NG schema and its embedded Schematron rules.

XHTML documents with embedded CSS, JS, PHP, and JSP scripts are rendered with dedicated coloring schemes. To customize them, *open the Preferences dialog box* and go to **Editor** > **Syntax Highlight**.

Spell Checking

Oxygen XML Developer plugin includes an *automatic* (*as-you-type*) *spell checking feature*, as well as a manual spell checking action to opens a **Spelling** dialog box that offers a variety of options. To open this dialog box, use the **Check Spelling** action on the toolbar.

Figure 172: The Check Spelling Dialog Box

The **Spelling** dialog box contains the following fields:

- Unrecognized word Contains the word that cannot be found in the selected dictionary. The word is also highlighted in the XML document.
- Replace with The character string which is suggested to replace the unrecognized word.
- **Guess** Displays a list of words suggested to replace the unknown word. Double click a word to automatically insert it in the document and resume the spell checking process.
- **Default language** Allows you to select the default dictionary used by the spelling engine.
- Paragraph language In an XML document you can mix content written in different languages. To tell the spell
 checker engine what language was used to write a specific section, you need to set the language code in thelang
 or xml:lang attribute to that section. Oxygen XML Developer plugin automatically detects such sections and
 instructs the spell checker engine to apply the appropriate dictionary.
- Replace Replaces the currently highlighted word in the XML document, with the selected word in the Replace with field.
- **Replace All** Replaces all occurrences of the currently highlighted word in the XML document, with the selected word in the **Replace with** field.

- **Ignore** Ignores the first occurrence of the unrecognized word and allows you to continue checking the document.Oxygen XML Developer plugin skips the content of the XML elements *marked as ignorable*.
- Ignore All Ignores all instances of the unknown word in the current document.
- Learn Includes the unrecognized word in the list of valid words.
- Options Sets the configuration options of the spell checker.
- **Begin at cursor position** Instructs the spell checker to begin checking the document starting from the current cursor position.
- Close Closes the dialog box.

Spell Checking Dictionaries

There are two spell checking engines available in Oxygen XML Developer plugin: **Hunspell** checker (default setting) and **Java** checker. You can set the spell check engine in the *Spell checking engine* preferences page. The dictionaries used by the two engines differ in format, so you need to follow specific procedures in order to add another dictionary to your installation of Oxygen XML Developer plugin.

Dictionaries for the Hunspell Checker

The Hunspell spell checker is open source and has LGPL license. The format of the Hunspell spell dictionary is supported by Mozilla, OpenOffice and the Chrome browser. Oxygen XML Developer plugin comes with the following built-in dictionaries for the Hunspell checker:

- English (US)
- English (UK)
- French
- German
- Spanish.

Each language-country variant combination has its specific dictionary. If you cannot find a Hunspell dictionary that is already built for your language, you can build the dictionary you need. To build a dictionary from this list follow *these instructions*.

Add Dictionaries and Term Lists for the Hunspell Checker

To add new spelling dictionaries to Oxygen XML Developer plugin, or to replace an existing one, follow these steps:

- **1.** *Download the files* you need for your language dictionary.
- 2. The downloaded .oxt file is a *zip* archive. If you are creating a new dictionary, copy the .aff and .dic files from this archive in the spell subfolder of the Oxygen XML Developer plugin preferences folder.

The Oxygen XML Developer plugin preferences folder is >, where [APPLICATION-DATA-FOLDER] is:

- C:\Users\[USER-NAME]\AppData\Roaming on Windows Vista/7/8/10
- [USER-HOME-FOLDER]/Library/Preferences on OS X
- [USER-HOME-FOLDER] on Linux
- If you are updating an existing dictionary, copy the .aff and .dic files into the folder [OXYGEN_DIR]/dicts/spell.
- **4.** Restart the application after copying the dictionary files.

Note: You can specify that Oxygen XML Developer plugin includes dictionaries and term lists from a custom location by selecting the **Include dictionaries and term list from** option and specifying its path in *the Dictionaries preferences page*.

Dictionaries for the Java Checker

A Java spell checker dictionary has the form of a .dar file located in the directory <code>[OXYGEN_DIR]/dicts</code>. Oxygen XML Developer plugin comes with the following built-in dictionaries for the Java checker:

• English (US)

- English (UK)
- English (Canada)
- French (France)
- French (Belgium)
- French (Canada)
- French (Switzerland)
- German (old orthography)
- German (new orthography)
- Spanish

A pre-built dictionary can be added by copying the corresponding .dar file to the folder [OXYGEN_DIR]/dicts and restarting Oxygen XML Developer plugin. There is one dictionary for each language-country variant combination.

Learned Words

Spell checker engines rely on dictionary to decide that a word is correctly spelled. To tell the spell checker engine that an unknown word is actually correctly spelled, you need to add that word to its dictionary. There are two ways to do this:

- Press the **Learn** button from the **Spelling** dialog box.
- Invoke the contextual menu on an unknown word, then press **Learn word**.

Learned words are stored into a persistent dictionary file. Its name is composed of the currently checked language code and the .tdi extension, for example en_US.tdi. It is located in the:

- [HOME_DIR]/AppData/Roaming/com.oxygenxml.developer/spell folder on Windows Vista/7/8/10.
- [HOME_DIR]/Application Data/com.oxygenxml.developer/spell folder on Windows XP.
- [HOME_DIR]/Library/Preferences/com.oxygenxml.developer/spell folder on OS X.
- [HOME_DIR]/com.oxygenxml.developer/spell folder on Linux.
- Note: To change this folder go to the *Editor* > *Spell Check* > *Dictionaries* preferences page.
 - **Note:** To delete items from the list of learned words, press **Delete learned words** in the *Editor* > *Spell Check* > *Dictionaries preferences page*.

Ignored Words (Elements)

The content of some XML elements like programlisting, codeblock, or screen should always be skipped by the spell checking process. The skipping can be done manually, word by word by the user using the **Ignore** button of *the Spelling dialog box*, or automatically by maintaining a set of known element names that should never be checked. You maintain this set of element names *in the user preferences* as a list of XPath expressions that match the elements.

Only a small subset of XPath expressions is supported, that is only the '/' and '//' separators and the '*' wildcard. Two examples of supported expressions are /a/*/b and //c/d/*.

Automatic Spell Check

Oxygen XML Developer plugin includes an option to automatically check the spelling as you type. This feature is disabled by default, but can be enabled and configured in the *Spell Check preferences page*. When the option is enabled, unknown words are highlighted and they offer a contextual menu that includes the following actions:

Delete Repeated Word

Allows you to delete repeated words.

Learn Word

Allows you to add the current unknown word to the persistent dictionary.

Spell check options

Opens the Spell Check preferences page.

Also, a list of words suggested by the spell checking engine as possible replacements of the unknown word is offered in the contextual menu.

Spell Checking in Multiple Files

The Check Spelling in Files action allows you to check the spelling on multiple local or remote documents. This action is available in the following locations:

• The contextual menu of the **Navigator** view.

The spelling corrections are displayed in *the Results view*, that allows you to group the reported errors as a tree with two levels.

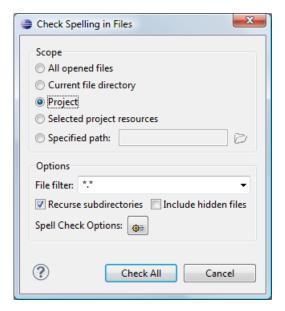

Figure 173: Check Spelling in Files Dialog Box

The following scopes are available:

- All opened files The spell check is performed in all opened files.
- **Directory of the current file** All the files in the folder of the current edited file.
- **Project files** All files from the current project.
- Selected project files The selected files from the current project.
- Specified path Checks the spelling in the files located at a path that you specify.

The **Options** section includes the following options:

- **File filter** Allow you to filter the files from the selected scope.
- **Recurse subdirectories** When enabled, the spell check is performed recursively for the specified scope. The one exception is that this option is ignored if the scope is set to **All opened files**.
- Include hidden files When enabled, the spell check is also performed in the hidden files.
- Spell Check Options The spell check processor uses the options available in the Spell Check preferences panel.

Handling Read-Only Files

The default workbench behavior applies when editing read-only files in the **Text** mode. For all other modes no modification is allowed provided that the file remains read-only.

You can check out the read-only state of the file by looking in the *Properties view*. If you modify the file properties from the operating system and the file becomes writable, you are able to modify it on the spot without having to reopen it.

Associating a File Extension with Oxygen XML Developer plugin

To associate a file extension with Oxygen XML Developer plugin on Windows:

- Go to the Start menu and click Control Panel.
- Go to **Default Programs**.
- Click Associate a file type or protocol with a program.
- Click the file extension you want to associate with Oxygen XML Developer plugin, then click Change program.
- In the Open With dialog box, click Browse and select Oxygen XML Developer plugin.

To associate a file extension with Oxygen XML Developer plugin on Mac OS:

- In **Finder**, right click a file and from the contextual menu select **Get Info**.
- In the **Open With** subsection, select **Other** from the application combo and browse to Oxygen XML Developer plugin.
- With Oxygen XML Developer plugin selected, click Change All.

Document Types (Frameworks)

Topics:

 Predefined Document Types (Frameworks) A *document type* or *framework* is associated to an XML file according to a set of rules. It also includes a variety of settings that improve editing capabilities in the **Author** mode for its particular file type. These settings include:

- A default grammar used for validation and content completion in **Text** mode.
- Predefined scenarios used for transformations for the class of XML documents defined by the document type.
- XML catalogs.
- Directories with file templates.

Oxygen XML Developer plugin comes with built-in support for many common document types. Each document type is defined in a framework. You can create new frameworks or make changes to existing frameworks to suit your individual requirements.

To see a video on configuring a framework in Oxygen XML Developer plugin, go to http://oxygenxml.com/demo/FrameworkConfiguration.html.

Predefined Document Types (Frameworks)

Predefined Document Types

The following predefined document types (frameworks) are fully supported in Oxygen XML Developer plugin and each of these document types include built-in transformation scenarios, validation, content completion and file templates:

- DocBook 4 A document type standard for books, articles, and other prose documents (particularly technical documentation).
- DocBook 5 An enhanced (version 5) document type standard designed for a variety of documents (particularly technical documentation).
- *DITA* An XML-based architecture designed for authoring, producing, and delivering technical information.
- *DITA Map* A document type that collects and organizes references to DITA topics or other maps.
- XHTML Extensible HyperText Markup Language includes the same depth of expression as HTML, but also conforms to XML syntax.
- TEI ODD Text Encoding Initiative One Document Does it all is an XML-conformant specification that allows you to create TEI P5 schema in a literate programming style.
- TEI P4 The Text Encoding Initiative guidelines is a standard for the academic community that collectively define an XML format for text that is primarily semantic rather than presentational.
- TEI P5 The Text Encoding Initiative guidelines is a standard for the academic community that collectively define an XML format for text that is primarily semantic rather than presentational.
- JATS The NISO Journal Article Tag Suite is a technical standard that defines an XML format for scientific literature.

Other Document Types

Oxygen XML Developer plugin also provides limited support (including file templates) for a variety of other document types, including:

- EPUB (NCX, OCF, OPF 2.0 & 3.0) A standard for e-book files.
- *DocBook Targetset* For resolving cross-references when using *olinks*.
- XSLT Stylesheets A document type that provides a visual mode for editing XSLT stylesheets.
- WSDL Web Services Description Language is an XML language for describing the functionality offered by a web service.
- Schematron For making assertions about the presence or absence of patterns in XML documents. This document type applies to the ISO Schematron version.
- Schematron Quick Fixes (SQF) An extension of the ISO standard Schematron, allows developers to define QuickFixes for Schematron errors.
- StratML (Part 1 & 2) Part 1 and 2 of the Strategy Markup Language specification.
- *XProc* A document type for processing XProc script files.
- *XML Schema* Documents that provide support for editing annotations.
- XLIFF (1.2 & 2.0) XML Localization Interchange File Format is a standard for passing data between tools during a localization process.
- *XQuery* The common query language for XML.
- CSS Cascading Style Sheets is a language used for describing the look and formatting of a document.
- LESS A dynamic style sheet language that can be compiled into CSS.
- Relax NG Schema A schema language that specifies a pattern for the structure and content of an XML document.
- NVDL Schema Namespace Validation Dispatching Language allows you to specify sections of XML documents to be validated against various schemas.
- JSON JavaScript Object Notation is a lightweight data-interchange format.
- JavaScript Programming language of HTML and the Web.
- XML Spec A markup language for W3C specifications and other technical reports.
- DITAVAL DITA conditional processing profile to identify the values you want to conditionally process for a particular output, build, or other purpose.

- Daisy A technical standard for digital audio books, periodicals, and computerized text. It is designed to be an audio substitute for print material.
- EAD Encoded Archival Description is an XML standard for encoding archival finding aids.
- KML Keyhole Markup Language is an XML notation for expressing geographic visualization in maps and browsers.
- Maven Project & Settings Project or settings file for Maven build automation tool that is primarily used for Java projects.
- Oasis XML Catalog A document that describes a mapping between external entity references and locally-cached equivalents.

The DocBook 4 Document Type

DocBook is a very popular set of tags for describing books, articles, and other prose documents, particularly technical documentation.

A file is considered to be a DocBook 4 document when one of the following conditions are true:

- The root element name is book or article.
- The PUBLIC ID of the document contains the string -//OASIS//DTD DocBook XML.

The default schema that is used if one is not detected in the DocBook 4 file is docbookxi.dtd and it is stored in [OXYGEN_DIR]/frameworks/docbook/4.5/dtd/.

The default XML catalog, catalog.xml, is stored in [OXYGEN_DIR]/frameworks/docbook/.

DocBook 4 Transformation Scenarios

Default transformation scenarios allow you to convert DocBook 4 to DocBook 5 documents and transform DocBook documents to WebHelp, PDF, HTML, HTML Chunk, XHTML, XHTML Chunk, EPUB and EPUB 3.

DocBook4 to WebHelp Output

DocBook 4 documents can be transformed into WebHelp systems, such as:

WebHelp Output

To publish DocBook 4 to WebHelp, follow these steps:

- 1. Click the Configure Transformation Scenario(s) action from the toolbar.
- 2. Select the **DocBook WebHelp** scenario from the **DocBook 4** section.
- 3. Click Apply associated.

When the **DocBook WebHelp** transformation is complete, the output is automatically opened in your default browser.

WebHelp With Feedback Output

To publish DocBook 4 to WebHelp With Feedback, follow these steps:

- 1. Click Configure Transformation Scenarios.
- 2. Select the DocBook WebHelp with Feedback scenario from the DocBook 4 section.
- 3. Click Apply associated.
- **4.** Enter the documentation product ID and the documentation version.

When the **DocBook WebHelp with Feedback** transformation is complete, your default browser opens the installation.html file. This file contains information about the output location, system requirements, installation instructions, and deployment of the output.

For further information about all the DocBook transformation parameters, go to http://docbook.sourceforge.net/release/xsl/current/doc/fo/index.html.

To watch our video demonstration about the feedback-enabled WebHelp system, go to http://oxygenxml.com/demo/Feedback_Enabled_WebHelp.html.

WebHelp Mobile Output

To generate a mobile WebHelp system from your DocBook 4 document, follow these steps:

- 1. Click **Configure Transformation Scenarios**.
- 2. Select the **DocBook WebHelp Mobile** scenario from the **DocBook 4** section.
- 3. Click Apply associated.

When the **DocBook WebHelp - Mobile** transformation is complete, the output is automatically opened in your default browser.

To further customize these out-of-the-box transformation, you can edit the following most commonly used parameters:

webhelp.copyright

Adds a small copyright text that appears at the end of the Table of Contents pane.

webhelp.footer.file

Path to an XML file that includes the footer content for your WebHelp output pages. You can use this parameter to integrate social media features (such as widgets for FacebookTM, TwitterTM, Google Analytics, or Google+TM). The file must be well-formed, each widget must be in separate div or span element, and the code for each script element is included in an XML comment (also, the start and end tags for the XML comment must be on a separate line). The following code exert is an example for adding a FacebookTM widget:

webhelp.footer.include

Specifies whether or not to include footer in each WebHelp page. Possible values: yes, no. If set to no, no footer is added to the WebHelp pages. If set to yes and the webhelp.footer.file parameter has a value, then the content of that file is used as footer. If the webhelp.footer.file has no value then the default Oxygen XML Developer plugin footer is inserted in each WebHelp page.

webhelp.logo.image (not available for the WebHelp Mobile transformation)

Specifies a path to an image displayed as a logo in the left side of the output header.

webhelp.logo.image.target.url (not available for the WebHelp Mobile transformation)

Specifies a target URL that is set on the logo image. When you click the logo image, you will be redirected to this address.

webhelp.search.ranking (not available for the WebHelp Mobile transformation)

If this parameter is set to false then the *5-star rating mechanism* is no longer included in the search results that are displayed on the **Search** tab (default setting is true).

webhelp.search.japanese.dictionary

The file path of the dictionary that will be used by the *Kuromoji* morphological engine that Oxygen XML Developer plugin uses for indexing Japanese content in the WebHelp pages. This indexer does not come bundled with Oxygen XML Developer plugin or the Oxygen XML WebHelp plugin. To use it, you need to download it from http://mvnrepository.com/artifact/org.apache.lucene/lucene-analyzers-kuromoji/4.0.0 and add it in the DITA_OT_DIR/plugins/com.oxygenxml.webhelp/lib directory.

use.stemming

Controls whether or not you want to include stemming search algorithms into the published output (default setting is false).

clean.output

Deletes all files from the output folder before the transformation is performed (only no and yes values are valid and the default value is no).

args.default.language

This parameter is used if the language is not detected in the DITA map. The default value is en-us.

110n.gentext.default.language

This parameter is used to identify the correct stemmer that differs from language to language. For example, for English the value of this parameter is en or for French it is fr, and so on.

webhelp.product.id (available only for the WebHelp with Feedback transformation)

This parameter specifies a short name for the documentation target, or product (for example, mobile-phone-user-guide, hvac-installation-guide).

Note: You can deploy documentation for multiple products on the same server.

Note: The following characters are not allowed in the value of this parameter: $< > / \setminus '$ () { } = ; * % + &.

webhelp.product.version (available only for the WebHelp with Feedback transformation)

Specifies the documentation version number (for example, 1.0, 2.5, etc.). New user comments are bound to this version.

Note: Multiple documentation versions can be deployed on the same server.

Note: The following characters are not allowed in the value of this parameter: $< > / \setminus '$ () $\{ \}$ = ; * % + &.

webhelp.skin.css (not available for the WebHelp Mobile transformation)

Path to a CSS file that sets the style theme in the output WebHelp pages. It can be one of the predefined skin CSS from the

OXYGEN_INSTALL_DIR\frameworks\docbook\xsl\com.oxygenxml.webhelp\predefined-skins directory, or it can be a custom skin CSS generated with the *Oxygen Skin Builder* web application.

DocBook to PDF Output Customization

Main steps for customization of PDF output generated from DocBook XML documents.

When the default layout and output look of the DocBook to PDF transformation need to be customized, the following main steps should be followed. In this example a company logo image is added to the front matter of a book. Other types of customizations should follow some similar steps.

1. Create a custom version of the DocBook title spec file.

You should start from a copy of the file

An example of spec file:

2. Generate a new XSLT stylesheet from the title spec file from the previous step.

Apply [OXYGEN_DIR]/frameworks/docbook/xsl/template/titlepage.xsl to the title spec file. The result is an XSLT stylesheet (for example, mytitlepages.xsl).

3. Import mytitlepages.xsl in a *DocBook customization layer*.

The customization layer is the stylesheet that will be applied to the XML document. The mytitlepages.xsl should be imported with an element like:

```
<xsl:import href="dir-name/mytitlepages.xsl"/>
```

4. Insert logo image in the XML document.

The path to the logo image must be inserted in the book/info/mediaobject element of the XML document.

5. Apply the customization layer to the XML document.

A quick way is duplicating the transformation scenario **DocBook PDF** that comes with Oxygen XML Developer plugin and set the customization layer in *the XSL URL property of the scenario*.

DocBook to EPUB Transformation

The EPUB specification recommends the use of *OpenType* fonts (recognized by their .otf file extension) when possible. To use a specific font, follow these steps:

1. Declare it in your CSS file, as in the following example:

```
@font-face {
font-family: "MyFont";
font-weight: bold;
font-style: normal;
src: url(fonts/MyFont.otf);
}
```

2. In the CSS, specify where this font is used. To set it as default for h1 elements, use the font-family rule, as in the following example:

```
h1 {
font-size:20pt;
margin-bottom:20px;
font-weight: bold;
font-family: "MyFont";
text-align: center;
}
```

3. In your DocBook to EPUB transformation, set the epub.embedded.fonts parameter to fonts/MyFont.otf. If you need to provide more files, use commas to separate their file paths.

Note: The html.stylesheet parameter allows you to include a custom CSS in the output EPUB.

DocBook 4 Templates

Default templates are available in the *New File* wizard. You and can use them to create a skeletal form of a DocBook 4 book or article. These templates are stored in the

[OXYGEN_DIR]/frameworks/docbook/templates/DocBook 4 folder.

Here are some of the DocBook 4 templates available when creating new documents from templates:

- Article
- Article with MathML
- Article with SVG
- · Article with XInclude
- Book
- · Book with XInclude
- Chapter
- Section
- Set of Books

Inserting an olink in DocBook Documents

An olink is a type of link between two DocBook XML documents.

The olink element is used for linking outside the current DocBook document. It has the attribute targetdoc for the document ID that contains the target element and the attribute targetptr for the ID (the value of an id or xml:id attribute) of the target element. The combination of those two attributes provides a unique identifier to locate cross references.

For example, a *Mail Administrator Guide* with the document ID MailAdminGuide might contain a chapter about user accounts, like this:

```
<chapter id="user_accounts">
<title>Administering User Accounts</title>
<para>blah blah</para>
...
```

You can form a cross reference to that chapter by adding an olink, as in the following example:

```
You may need to update your 
<olink targetdoc="MailAdminGuide" targetptr="user_accounts">user accounts 
</olink> 
when you get a new machine.
```

To use an olink to create links between documents, follow these steps:

1. Decide what documents are to be included in the domain for cross referencing.

A unique ID must be assigned to each document that will be referenced with an olink. It is usually added as an id (or xml:id for DocBook5) attribute to the root element of the document.

2. Decide on your output hierarchy.

For creating links between documents, the relative locations of the output documents must be known. Before going further you must decide the names and locations of the output directories for all the documents from the domain. Each directory will be represented by an element <dir name="directory_name"> in the target database document.

3. Create the target database document.

Each collection of documents has a master target database document that is used to resolve all olinks from that collection. The target database document is an XML file that is created once. It provides a framework that pulls in the target data for each document. The database document is static and all the document data is pulled in dynamically.

The following is an example target database document. It structures the documents in the collection into a sitemap element that provides the relative locations of the outputs (HTML in this example). Then it pulls in the individual target data using system entity references to target data files that will be created in the next step.

```
<?xml version="1.0" encoding="utf-8"?>
<!DOCTYPE targetset [
<!ENTITY ugtargets SYSTEM "file:///doc/userguide/target.db">
<!ENTITY agtargets SYSTEM "file:///doc/adminguide/target.db">
<!ENTITY reftargets SYSTEM "file:///doc/man/target.db">
<targetset>
 <targetsetinfo>
   Description of this target database document,
   which is for the examples in olink doc.
  </targetsetinfo>
  <!-- Site map for generating relative paths between documents -->
 <sitemap>
   <dir name="documentation">
     <dir name="guides">
       <dir name="mailuser">
          <document targetdoc="MailUserGuide"</pre>
                    baseuri="userguide.html">
           &ugtargets;
         </document>
        </dir>
        <dir name="mailadmin">
          <document targetdoc="MailAdminGuide">
           &agtargets;
          </document>
        </dir>
      </dir>
      <dir name="reference">
        <dir name="mailref">
         <document targetdoc="MailReference">
           &reftargets;
          </document>
        </dir>
      </dir>
```

```
</dir>
</sitemap>
</targetset>
```

4. Generate the target data files by executing a DocBook transformation scenario.

Before applying the transformation, you need to edit the transformation scenario, go to **Parameters**, and make sure the value of the collect.xref.targets parameter is set to yes. The default name of a target data file is target.db, but it can be changed by setting an absolute file path in the targets.filename parameter. An example of a target.db file:

```
<div element="book" href="#MailAdminGuide" number="1" targetptr="user_accounts">
  <ttl>Administering User Accounts</ttl>
  <xreftext>How to administer user accounts/xreftext>
  <div element="part" href="#d5e4" number="I">
    <ttl>First Part</ttl>
    <xreftext>Part I, "First Part"</xreftext>
    <div element="chapter" href="#d5e6" number="1">
      <ttl>Chapter Title</ttl>
      <xreftext>Chapter 1, Chapter Title
      <div element="sect1" href="#src_chapter" number="1"</pre>
targetptr="src_chapter">
        <ttl>Section1 Title</ttl>
        <xreftext>xreflabel_here</xreftext>
      </div>
    </div>
  </div>
</div>
```

5. Insert olink elements in the DocBook documents.

When editing a DocBook XML document in **Author** mode, the **Insert OLink** action is available in the ***** Link** drop-down menu from the toolbar. This action opens the **Insert OLink** dialog box that allows you to select the target of an olink from the list of all possible targets from a specified target database document (specified in the **Targetset URL** field). Once a **Targetset URL** is selected, the structure of the target documents is presented. For each target document (targetdoc), its content is displayed allowing you to easily identify the appropriate targetptr. You can also use the search fields to quickly identify a target. If you already know the values for the targetdoc and targetptr, you can insert them directly in the corresponding fields.

In the following image, the target database document is called target.xml, *dbadmin* is selected for the target document (targetdoc), and *bldinit* is selected as the value for the targetptr attribute. Notice that you can also add XREF text into the olink by using the xreftext field.

The DocBook 5 Document Type

A file is considered to be a DocBook 5 document when the namespace is http://docbook.org/ns/docbook.

The default schema that is used if one is not detected in the DocBook 5 file is docbookxi.rng and it is stored in [OXYGEN_DIR]/frameworks/docbook/5.0/rng/. Other types of schemas are also located in various folders inside the [OXYGEN_DIR]/frameworks/docbook/5.0/ directory (for example, XML Schema files are located in the xsd folder).

The default XML catalog, catalog.xml, is stored in [OXYGEN_DIR]/frameworks/docbook/5.0/.

Note: A default XML catalog and schema files for experimental DocBook 5.1 documents are also available in the [OXYGEN_DIR]/frameworks/docbook/5.1/ directory.

DocBook 5 Transformation Scenarios

Default transformation scenarios allow you to transform DocBook 5 documents to WebHelp, PDF, HTML, HTML Chunk, XHTML, XHTML Chunk, EPUB, and EPUB 3.

DocBook 5 to WebHelp Output

DocBook 5 documents can be transformed into WebHelp systems, such as:

WebHelp Output

To publish DocBook 5 to WebHelp, follow these steps:

- 1. Click the **Configure Transformation Scenario(s)** action from the toolbar.
- 2. Select the **DocBook WebHelp** scenario from the **DocBook 5** section.
- 3. Click Apply associated.

When the DocBook WebHelp transformation is complete, the output is automatically opened in your default browser.

WebHelp With Feedback Output

To publish DocBook 5 to WebHelp With Feedback, follow these steps:

- 1. Click Configure Transformation Scenarios.
- 2. Select the **DocBook WebHelp with Feedback** scenario from the **DocBook 5** section.
- 3. Click Apply associated.
- 4. Enter the documentation product ID and the documentation version.

When the **DocBook WebHelp with Feedback** transformation is complete, your default browser opens the installation.html file. This file contains information about the output location, system requirements, installation instructions, and deployment of the output.

For further information about all the DocBook transformation parameters, go to http://docbook.sourceforge.net/release/xsl/current/doc/fo/index.html.

To watch our video demonstration about the feedback-enabled WebHelp system, go to http://oxygenxml.com/demo/Feedback_Enabled_WebHelp.html.

WebHelp Mobile Output

To generate a mobile WebHelp system from your DocBook 5 document, follow these steps:

- 1. Click Configure Transformation Scenarios.
- 2. Select the $DocBook\ WebHelp$ $Mobile\ scenario\ from\ the\ DocBook\ 5$ section.
- 3. Click Apply associated.

When the **DocBook WebHelp - Mobile** transformation is complete, the output is automatically opened in your default browser.

To further customize these out-of-the-box transformation, you can edit the following most commonly used parameters:

webhelp.copyright

Adds a small copyright text that appears at the end of the *Table of Contents* pane.

webhelp.footer.file

Path to an XML file that includes the footer content for your WebHelp output pages. You can use this parameter to integrate social media features (such as widgets for Facebook[™], Twitter[™], Google Analytics, or Google+[™]). The file must be well-formed, each widget must be in separate div or span element, and the code for each script element is included in an XML comment (also, the start and end tags for the XML comment must be on a separate line). The following code exert is an example for adding a Facebook[™] widget:

webhelp.footer.include

Specifies whether or not to include footer in each WebHelp page. Possible values: yes, no. If set to no, no footer is added to the WebHelp pages. If set to yes and the webhelp.footer.file parameter has a value, then the

content of that file is used as footer. If the webhelp.footer.file has no value then the default Oxygen XML Developer plugin footer is inserted in each WebHelp page.

webhelp.logo.image (not available for the WebHelp Mobile transformation)

Specifies a path to an image displayed as a logo in the left side of the output header.

webhelp.logo.image.target.url (not available for the WebHelp Mobile transformation)

Specifies a target URL that is set on the logo image. When you click the logo image, you will be redirected to this address.

webhelp.search.ranking (not available for the WebHelp Mobile transformation)

If this parameter is set to false then the *5-star rating mechanism* is no longer included in the search results that are displayed on the **Search** tab (default setting is true).

webhelp.search.japanese.dictionary

The file path of the dictionary that will be used by the *Kuromoji* morphological engine that Oxygen XML Developer plugin uses for indexing Japanese content in the WebHelp pages. This indexer does not come bundled with Oxygen XML Developer plugin or the Oxygen XML WebHelp plugin. To use it, you need to download it from http://mvnrepository.com/artifact/org.apache.lucene/lucene-analyzers-kuromoji/4.0.0 and add it in the DITA_OT_DIR/plugins/com.oxygenxml.webhelp/lib directory.

use.stemming

Controls whether or not you want to include stemming search algorithms into the published output (default setting is false).

clean.output

Deletes all files from the output folder before the transformation is performed (only no and yes values are valid and the default value is no).

args.default.language

This parameter is used if the language is not detected in the DITA map. The default value is en-us.

110n.gentext.default.language

This parameter is used to identify the correct stemmer that differs from language to language. For example, for English the value of this parameter is en or for French it is fr, and so on.

webhelp.product.id (available only for the WebHelp with Feedback transformation)

This parameter specifies a short name for the documentation target, or product (for example, mobile-phone-user-guide, hvac-installation-guide).

F	Note:	You can	deploy	documen	tation for	r multiple	products	on the	same serv	er.
---	-------	---------	--------	---------	------------	------------	----------	--------	-----------	-----

F	Note: The following characters are not allowed in the value of this parameter: < > / \ ' () {	}
	= ; * % + &.	

webhelp.product.version (available only for the WebHelp with Feedback transformation)

Specifies the documentation version number (for example, 1.0, 2.5, etc.). New user comments are bound to this version.

webhelp.skin.css (not available for the WebHelp Mobile transformation)

Path to a CSS file that sets the style theme in the output WebHelp pages. It can be one of the predefined skin CSS from the

OXYGEN_INSTALL_DIR\frameworks\docbook\xsl\com.oxygenxml.webhelp\predefined-skins directory, or it can be a custom skin CSS generated with the *Oxygen Skin Builder* web application.

DocBook to PDF Output Customization

Main steps for customization of PDF output generated from DocBook XML documents.

When the default layout and output look of the DocBook to PDF transformation need to be customized, the following main steps should be followed. In this example a company logo image is added to the front matter of a book. Other types of customizations should follow some similar steps.

1. Create a custom version of the DocBook title spec file.

You should start from a copy of the file

[OXYGEN_DIR]/frameworks/docbook/xsl/fo/titlepage.templates.xml and customize it. The instructions for the spec file can be found *here*.

An example of spec file:

2. Generate a new XSLT stylesheet from the title spec file from the previous step.

Apply [OXYGEN_DIR]/frameworks/docbook/xsl/template/titlepage.xsl to the title spec file. The result is an XSLT stylesheet (for example, mytitlepages.xsl).

3. Import mytitlepages.xsl in a *DocBook customization layer*.

The customization layer is the stylesheet that will be applied to the XML document. The mytitlepages.xsl should be imported with an element like:

```
<xsl:import href="dir-name/mytitlepages.xsl"/>
```

4. Insert logo image in the XML document.

The path to the logo image must be inserted in the book/info/mediaobject element of the XML document.

5. Apply the customization layer to the XML document.

A quick way is duplicating the transformation scenario **DocBook PDF** that comes with Oxygen XML Developer plugin and set the customization layer in *the XSL URL property of the scenario*.

DocBook to EPUB Transformation

The EPUB specification recommends the use of *OpenType* fonts (recognized by their .otf file extension) when possible. To use a specific font, follow these steps:

1. Declare it in your CSS file, as in the following example:

```
@font-face {
font-family: "MyFont";
font-weight: bold;
font-style: normal;
src: url(fonts/MyFont.otf);
}
```

2. In the CSS, specify where this font is used. To set it as default for h1 elements, use the font-family rule, as in the following example:

```
h1 {
  font-size:20pt;
  margin-bottom:20px;
  font-weight: bold;
  font-family: "MyFont";
  text-align: center;
}
```

3. In your DocBook to EPUB transformation, set the epub. embedded. fonts parameter to fonts/MyFont.otf. If you need to provide more files, use commas to separate their file paths.

Note: The html.stylesheet parameter allows you to include a custom CSS in the output EPUB.

DocBook 5 Templates

Default templates are available in the *New File wizard* and can be used for easily creating a skeletal form of a DocBook 5 book or article. These templates are stored in the

[OXYGEN DIR]/frameworks/docbook/templates/DocBook 5 folder.

Here are some of the DocBook 5 templates available when creating new documents from templates:

- Article
- · Article with MathML
- · Article with SVG
- · Article with XInclude
- Book
- Book with XInclude
- Chapter
- Section
- Set of Books

Some experimental DocBook 5.1 templates are also available and are stored in the [OXYGEN_DIR]/frameworks/docbook/templates/DocBook 5.1 (Experimental) folder. They include the following:

Inserting an olink in DocBook Documents

An olink is a type of link between two DocBook XML documents.

The olink element is used for linking outside the current DocBook document. It has the attribute targetdoc for the document ID that contains the target element and the attribute targetptr for the ID (the value of an id or xml:id attribute) of the target element. The combination of those two attributes provides a unique identifier to locate cross references.

For example, a *Mail Administrator Guide* with the document ID MailAdminGuide might contain a chapter about user accounts, like this:

```
<chapter id="user_accounts">
<title>Administering User Accounts</title>
<para>blah blah</para>

```

You can form a cross reference to that chapter by adding an olink, as in the following example:

```
You may need to update your
<olink targetdoc="MailAdminGuide" targetptr="user_accounts">user accounts
</olink>

```

To use an olink to create links between documents, follow these steps:

1. Decide what documents are to be included in the domain for cross referencing.

A unique ID must be assigned to each document that will be referenced with an olink. It is usually added as an id (or xml:id for DocBook5) attribute to the root element of the document.

2. Decide on your output hierarchy.

  <targetsetinfo>
    Description of this target database document,
    which is for the examples in olink doc.
  </targetsetinfo>
  <!-- Site map for generating relative paths between documents -->
    <dir name="documentation">
      <dir name="quides">
        <dir name="mailuser">
          <document targetdoc="MailUserGuide"</pre>
                      baseuri="userguide.html">
            &ugtargets;
          </document>
        </dir>
        <dir name="mailadmin">
           <document targetdoc="MailAdminGuide">
             &agtargets;
           </document>
        </dir>
      </dir>
      <dir name="reference">
        <dir name="mailref">
          <document targetdoc="MailReference">
            &reftargets;
           </document>
        </dir>
      </dir>
    </dir>
  </sitemap>
</targetset>
```

4. Generate the target data files by executing a DocBook transformation scenario.

Before applying the transformation, you need to edit the transformation scenario, go to **Parameters**, and make sure the value of the collect.xref.targets parameter is set to yes. The default name of a target data file is target.db, but it can be changed by setting an absolute file path in the targets.filename parameter.

An example of a target.db file:

```
<div element="book" href="#MailAdminGuide" number="1" targetptr="user_accounts">
  <ttl>Administering User Accounts</ttl>
  <xreftext>How to administer user accounts/xreftext>
  <div element="part" href="#d5e4" number="I">
   <ttl>First Part</ttl>
    <xreftext>Part I, "First Part"</xreftext>
    <div element="chapter" href="#d5e6" number="1">
      <ttl>Chapter Title</ttl>
      <xreftext>Chapter 1, Chapter Title
      <div element="sect1" href="#src_chapter" number="1"</pre>
targetptr="src_chapter">
       <ttl>Section1 Title</ttl>
        <xreftext>xreflabel_here</xreftext>
      </div>
   </div>
  </div>
</div>
```

5. Insert olink elements in the DocBook documents.

When editing a DocBook XML document in **Author** mode, the **Insert OLink** action is available in the **Strink** drop-down menu from the toolbar. This action opens the **Insert OLink** dialog box that allows you to select the target of an olink from the list of all possible targets from a specified target database document (specified in the **Targetset URL** field). Once a **Targetset URL** is selected, the structure of the target documents is presented. For each target document (targetdoc), its content is displayed allowing you to easily identify the appropriate targetptr. You can also use the search fields to quickly identify a target. If you already know the values for the targetdoc and targetptr, you can insert them directly in the corresponding fields.

In the following image, the target database document is called target.xml, *dbadmin* is selected for the target document (targetdoc), and *bldinit* is selected as the value for the targetptr attribute. Notice that you can also add XREF text into the olink by using the xreftext field.

- 6. Process a DocBook transformation each document to generate its output.
 - a) Edit the transformation scenario and set the value of the target.database.document parameter to be the URL of the target database document.
 - b) Apply the transformation scenario.

The DITA Topics Document Type

The Darwin Information Typing Architecture (DITA) is an XML-based architecture oriented to authoring, producing, and delivering technical information. It divides content into small, self-contained topics that you can reuse in various deliverables. The extensibility of DITA permits organizations to define specific information structures while still using standard tools to work with them. Oxygen XML Developer plugin provides schema-driven (DTD, RNG, XSD) templates for DITA documents.

A file is considered to be a DITA topic document when one of the following conditions are true:

- The root element name is one of the following: concept, task, reference, dita, or topic.
- The PUBLIC ID of the document is a PUBLIC ID for the elements listed above.

• The root element of the file has an attribute named DITAArchVersion for the "http://dita.oasis-open.org/architecture/2005/" namespace. This enhanced case of matching is only applied when the **Enable DTD/XML Schema processing in document type detection** option is enabled from the **Document Type****Association preferences page.

Default schemas that are used if one is not detected in the DITA documents are stored in the various folders inside [OXYGEN_DIR]/frameworks/dita/DITA-OT/dtd/ or [OXYGEN_DIR]/frameworks/dita/DITA-OT/schema/ (or if you are using DITA 2.x, inside [OXYGEN_DIR]/frameworks/dita/DITA-OT2.x/dtd/ or [OXYGEN_DIR]/frameworks/dita/DITA-OT2.x/schema/).

The default catalogs for the DITA topic document type are as follows:

- [OXYGEN DIR]/frameworks/dita/catalog.xml
- [OXYGEN_DIR]/frameworks/dita/DITA-OT/catalog-dita.xml (or if you are using DITA 2.x, [OXYGEN_DIR]/frameworks/dita/DITA-OT2.x/catalog-dita.xml)
- [OXYGEN_DIR]/frameworks/dita/plugin/catalog.xml
- [OXYGEN_DIR]/frameworks/dita/styleguide/catalog.xml

DITA Transformation Scenarios

The following default transformation scenarios are available for DITA Topics:

- **DITA XHTML** Transforms a DITA topic to XHTML using DITA Open Toolkit.
- **DITA PDF** Transforms a DITA topic to PDF using the DITA Open Toolkit and the Apache FOP engine.

DITA Templates

The default templates available for DITA topics are stored in various sub-folders inside the [OXYGEN_DIR]/frameworks/dita/templates/ folder. They can be used for easily creating a DITA concept, reference, task, topic, or other DITA documents.

Here are some of the DITA templates available when creating new documents from templates:

- Composite New DITA Composite
- Concept New DITA Concept
- General Task New DITA Task
- Glossentry New DITA Glossentry
- Glossgroup New DITA Glossgroup
- Machinery Task New DITA Machinery Task
- Reference New DITA Reference
- Task New DITA Task
- **Topic** New DITA Topic
- Learning Assessment New DITA Learning Assessment (learning specialization in DITA 1.2)
- Learning Content New DITA Learning Content (learning specialization in DITA 1.2)
- Learning Summary New DITA Learning Summary (learning specialization in DITA 1.2)
- Learning Overview New DITA Learning Overview (learning specialization in DITA 1.2)
- Learning Plan New DITA Learning Plan (learning specialization in DITA 1.2)
- Troubleshooting Experimental DITA 1.3 troubleshooting specialization

DITA for Publishers topic specialization templates (available when using the built-in DITA-OT 1.8 version):

- **D4P Article** New DITA for Publishers article
- **D4P Chapter** New DITA for Publishers chapter
- **D4P Concept** New DITA for Publishers concept
- **D4P Conversion Configuration** New DITA for Publishers conversion configuration
- **D4P Cover** New DITA for Publishers cover
- **D4P Part** New DITA for Publishers part

- **D4P Sidebar** New DITA for Publishers sidebar
- **D4P Subsection** New DITA for Publishers subsection
- **D4P Topic** New DITA for Publishers topic

Note: If you select the *built-in DITA-OT 2.x* (*with experimental DITA 1.3 support*) option in the DITA *Preferences Page*, you will also have access to some experimental templates for DITA 1.3.

The DITA Map Document Type

DITA maps are documents that collect and organize references to DITA topics to indicate the relationships among the topics. They can also serve as outlines or tables of contents for DITA deliverables and as build manifests for DITA projects.

Maps allow scalable reuse of content across multiple contexts. They can be used by information architects, authors, and publishers to plan, develop, and deliver content.

A file is considered to be a DITA map document when either of the following is true:

- The root element name is one of the following: map, bookmap.
- The public id of the document is -//OASIS//DTD DITA Map or -//OASIS//DTD DITA BookMap.
- The root element of the file has an attribute named class which contains the value map/map and a DITAArchVersion attribute from the http://dita.oasis-open.org/architecture/2005/ namespace. This enhanced case of matching is only applied when the **Enable DTD processing** option from the **Document Type Association** preferences page is enabled.

Default schemas that are used if one is not detected in the DITA map document are stored in the various folders inside [OXYGEN_DIR]/frameworks/dita/DITA-OT/dtd/ or

```
[OXYGEN_DIR]/frameworks/dita/DITA-OT/schema/ (or if you are using DITA 2.x, inside [OXYGEN_DIR]/frameworks/dita/DITA-OT2.x/dtd/ or [OXYGEN_DIR]/frameworks/dita/DITA-OT2.x/schema/).
```

The default catalogs for the DITA Map document type are as follows:

- [OXYGEN_DIR]/frameworks/dita/catalog.xml
- [OXYGEN_DIR]/frameworks/dita/DITA-OT/catalog-dita.xml (or if you are using DITA 2.x, [OXYGEN_DIR]/frameworks/dita/DITA-OT2.x/catalog-dita.xml)

DITA Map Transformation Scenarios

The following default transformations are available:

- Predefined transformation scenarios allow you to transform a DITA map to PDF, ODF, XHTML, WebHelp, EPUB, and CHM files.
- **Run DITA-OT Integrator** Use this transformation scenario if you want to integrate a DITA-OT plugin. This scenario runs an Ant task that integrates all the plug-ins from the DITA-OT/plugins directory.
- **DITA Map Metrics Report** Use this transformation scenario if you want to generate a DITA map statistics report containing information such as:
 - The number of processed maps and topics.
 - Content reuse percentage.
 - · Number of elements, attributes, words, and characters used in the entire DITA map structure.
 - DITA conditional processing attributes used in the DITA maps.
 - Words count.
 - Information types such as number of containing maps, bookmaps, or topics.

Many more output formats are available by clicking the **New** button. The transformation process relies on the DITA Open Toolkit.

DITA Map to WebHelp Output

DITA maps can be transformed into WebHelp systems.

WebHelp Output

To publish a DITA map to WebHelp, follow these steps:

- 1. Click the Configure Transformation Scenario(s) action from the toolbar.
- 2. Select the DITA Map WebHelp scenario from the DITA Map section.
- 3. Click Apply associated.

When the **DITA Map WebHelp** transformation is complete, the output is automatically opened in your default browser.

WebHelp With Feedback Output

To publish a DITA map as WebHelp with Feedback:

- 1. Click Configure Transformation Scenarios.
- 2. Select the DITA Map WebHelp with Feedback scenario from the DITA Map section.
- 3. Click Apply associated.
- **4.** Enter the documentation product ID and the documentation version.

When the **DITA Map WebHelp with Feedback** transformation is complete, your default browser opens the installation.html file. This file contains information about the output location, system requirements, installation instructions, and deployment of the output.

To watch our video demonstration about the feedback-enabled WebHelp system, go to http://oxygenxml.com/demo/Feedback_Enabled_WebHelp.html.

WebHelp Mobile Output

To generate a mobile WebHelp system from your DITA map:

- 1. From the DITA Maps Manager view click Configure Transformation Scenarios.
- 2. Select the **DITA Map WebHelp Mobile** transformation scenario.
- 3. Click Apply associated.

When the **DITA Map WebHelp - Mobile** transformation is complete, the output is automatically opened in your default browser.

Once Oxygen XML Developer plugin finishes the transformation process, the output is automatically opened in your default browser.

 $To further \ customize \ these \ out-of-the-box \ transformation, \ you \ can \ edit \ the \ following \ most \ commonly \ used \ parameters:$

webhelp.sitemap.base.url

Base URL for all the loc elements in the generated sitemap.xml file. The value of a loc element is computed as the relative file path from the href attribute of a topicref element from the DITA map, appended to this base URL value. The loc element is mandatory in sitemap.xml. If you leave this parameter set to its default empty value, then the sitemap.xml file is not generated.

webhelp.sitemap.change.frequency

The value of the changefreq element in the generated sitemap.xml file. The changefreq element is optional in sitemap.xml. If you leave this parameter set to its default empty value, then the changefreq element is not added in sitemap.xml. Allowed values: <empty string> (default), always, hourly, daily, weekly, monthly, yearly, never.

webhelp.sitemap.priority

The value of the priority element in the generated sitemap.xml file. It can be set to any fractional number between 0.0 (least important priority) and 1.0 (most important priority), such as: 0.3, 0.5, 0.8, etc. The priority element is optional in sitemap.xml. If you leave this parameter set to its default empty value, then the priority element is not added in sitemap.xml.

webhelp.copyright

Adds a small copyright text that appears at the end of the *Table of Contents* pane.

webhelp.footer.file

Path to an XML file that includes the footer content for your WebHelp output pages. You can use this parameter to integrate social media features (such as widgets for FacebookTM, TwitterTM, Google Analytics, or Google+TM). The file must be well-formed, each widget must be in separate div or span element, and the code for each script element is included in an XML comment (also, the start and end tags for the XML comment must be on a separate line). The following code exert is an example for adding a FacebookTM widget:

webhelp.footer.include

Specifies whether or not to include footer in each WebHelp page. Possible values: yes, no. If set to no, no footer is added to the WebHelp pages. If set to yes and the webhelp.footer.file parameter has a value, then the content of that file is used as footer. If the webhelp.footer.file has no value then the default Oxygen XML Developer plugin footer is inserted in each WebHelp page.

webhelp.logo.image (not available for the WebHelp Mobile transformation)

Specifies a path to an image displayed as a logo in the left side of the output header.

webhelp.logo.image.target.url (not available for the WebHelp Mobile transformation)

Specifies a target URL that is set on the logo image. When you click the logo image, you will be redirected to this address.

webhelp.search.ranking (not available for the WebHelp Mobile transformation)

If this parameter is set to false then the *5-star rating mechanism* is no longer included in the search results that are displayed on the **Search** tab (default setting is true).

webhelp.search.japanese.dictionary

The file path of the dictionary that will be used by the <code>Kuromoji</code> morphological engine that Oxygen XML Developer plugin uses for indexing Japanese content in the WebHelp pages. This indexer does not come bundled with Oxygen XML Developer plugin or the Oxygen XML WebHelp plugin. To use it, you need to download it from <code>http://mvnrepository.com/artifact/org.apache.lucene/lucene-analyzers-kuromoji/4.0.0</code> and add it in the <code>DITA_OT_DIR/plugins/com.oxygenxml.webhelp/lib</code> directory.

webhelp.google.search.script

Specifies the location of a well-formed XHTML file containing the Custom Search Engine script from Google. The value must be an URL.

webhelp.google.search.results

URL value that specifies the location of a well-formed XHTML file containing the Google Custom Search Engine element gcse:searchresults-only. You can use all supported attributes for this element. It is recommend to set the linkTarget attribute to frm for frameless (*iframe*) version of WebHelp or to contentWin for the frameset version of WebHelp. The default value for this attribute is _blank and the search results will be loaded in a new window. If this parameter is not specified, the following code will be used

```
<gcse:searchresults-only linkTarget="frm"></gcse:searchresults-only>
```

use.stemming

Controls whether or not you want to include stemming search algorithms into the published output (default setting is false).

clean.output

Deletes all files from the output folder before the transformation is performed (only no and yes values are valid and the default value is no).

args.default.language

This parameter is used if the language is not detected in the DITA map. The default value is en-us.

webhelp.head.script

URL value that specifies the location of a well-formed XHTML file containing the custom script that will be copied in the <head> section of every WebHelp page.

webhelp.body.script

URL value that specifies the location of a well-formed XHTML file containing the custom script that will be copied in the <body> section of every WebHelp page.

fix.external.refs.com.oxygenxml (Only supported when the DITA OT transformation process is started from Oxygen XML Developer plugin)

The DITA Open Toolkit usually has problems processing references that point to locations outside of the directory of the processed DITA map. This parameter is used to specify whether or not the application should try to fix such references in a temporary files folder before the DITA Open Toolkit is invoked on the fixed references. The fix has no impact on your edited DITA content. Allowed values: true or false (default).

Support for Right-to-Left (RTL) Oriented Languages

To activate support for RTL languages in WebHelp output, edit the DITA map and set the xml:lang attribute on its root element (map). The corresponding attribute value can be set for following RTL languages:

- ar-eq Arabic
- he-il-Hebrew
- ur-pk Urdu

WebHelp Search Engine Optimization

A **DITA Map WebHelp** transformation scenario can be configured to produce a sitemap.xml file that is used by search engines to aid crawling and indexing mechanisms. A *sitemap* lists all pages of a WebHelp system and allows webmasters to provide additional information about each page, such as the date it was last updated, change frequency, and importance of each page in relation to other pages in your WebHelp deployment.

The structure of the sitemap.xml file looks like this:

Each page has a <url> element structure containing additional information, such as:

• loc - the URL of the page. This URL must begin with the protocol (such as http), if required by your web server. It is constructed from the value of the webhelp.sitemap.base.url parameter from the transformation scenario and the relative path to the page (collected from the href attribute of a topicref element in the DITA map).

Note: The value must have less than 2,048 characters.

- lastmod the date when the page was last modified. The date format is YYYY-MM-DD.
- changefreq indicates how frequently the page is likely to change. This value provides general information to assist search engines, but may not correlate exactly to how often they crawl the page. Valid values are: always, hourly, daily, weekly, monthly, yearly, and never. The first time the sitemap.xml file is generated, the value is set based upon the value of the webhelp.sitemap.change.frequency parameter in the DITA WebHelp transformation scenario. You can change the value in each url element by editing the sitemap.xml file.
 - Ē,

Note: The value always should be used to describe documents that change each time they are accessed. The value never should be used to describe archived URLs.

• priority - the priority of this page relative to other pages on your site. Valid values range from 0.0 to 1.0. This value does not affect how your pages are compared to pages on other sites. It only lets the search engines know which pages you deem most important for the crawlers. The first time the sitemap.xml file is generated, the value is set based upon the value of the webhelp.sitemap.priority parameter in the DITA WebHelp transformation scenario. You can change the value in each url element by editing the sitemap.xml file.

Note: lastmod, changefreq, and priority are optional elements.

Creating and Editing the sitemap.xml File

Follow these steps to produce a sitemap.xml file for your WebHelp system, which can then be edited to fine-tune search engine optimization:

- 1. Edit the transformation scenario you currently use for obtaining your WebHelp output. This opens the Edit DITA Scenario dialog box.
- 2. Open the **Parameters** tab and set a value for the following parameters:
 - webhelp.sitemap.base.url the URL of the location where your WebHelp system is deployed
 - 5

Note: This parameter is required in order for Oxygen XML Developer plugin to generate the sitemap.xml file.

- webhelp.sitemap.change.frequency-how frequently the WebHelp pages are likely to change (accepted values are: always, hourly, daily, weekly, monthly, yearly, and never)
- webhelp.sitemap.priority the priority of each page (value ranging from 0.0 to 1.0)
- **3.** Run the transformation scenario.
- **4.** Look for the sitemap.xml file in the transformation's output folder. Edit the file to fine-tune the parameters of each page, according to your needs.

Indexing Japanese Content in WebHelp Pages

To optimize the indexing of Japanese content in WebHelp pages generated from DITA map transformations, the Kuromoji analyzer can be used. This analyzer in not included in the Oxygen XML Developer plugin installation kit and must be downloaded and added.

To use the Kuromoji analyzer to index Japanese content in your WebHelp system, follow these steps:

- 1. Download the analyzer jar file from http://mvnrepository.com/artifact/org.apache.lucene/lucene-analyzers-kuromoji/4.0.0.
- **2.** Place the Kuromoji analyzer jar file in the following directory: DITA_OT_DIR/plugins/com.oxygenxml.webhelp/lib.
- **3.** For the analyzer to work properly, search terms that are entered into your WebHelp pages must be separated by spaces.

Optionally a Japanese user dictionary can be set with the webhelp.search.japanese.dictionary parameter.

Compiled HTML Help (CHM) Output Format

To perform a **Compiled HTML Help (CHM)** transformation Oxygen XML Developer plugin needs Microsoft HTML Help Workshop to be installed on your computer. Oxygen XML Developer plugin automatically detects HTML Help Workshop and uses it.

Note: HTML Help Workshop might fail if the files used for transformation contain accents in their names, due to different encodings used when writing the *.hhp* and *.hhc* files. If the transformation fails to produce the CHM output but the *.hhp* (HTML Help Project) file is already generated, you can manually try to build the CHM output using HTML Help Workshop.

Changing the Output Encoding

Oxygen XML Developer plugin uses the htmlhelp.locale parameter to correctly display specific characters of different languages in the output of the **Compiled HTML Help (CHM)** transformation. The **Compiled HTML Help (CHM)** default scenario that comes bundled with Oxygen XML Developer plugin has the htmlhelp.locale parameter set to en-US.

The default value of the htmlhelp.locale is en-US. To customize this parameter, go to Configure

Transformation Scenarios and click the Little button. In the parameter tab search for the htmlhelp.locale parameter and change its value to the desired language tag.

The format of the htmlhelp.locale parameter is LL-CC, where LL represents the language code (en for example) and CC represents the country code (US for example). The language codes are contained in the ISO 639-1 standard and the country codes are contained in the ISO 3166-1 standard. For further details about language tags, go to http://www.rfc-editor.org/rfc/rfc5646.txt.

Kindle Output Format

Oxygen XML Developer plugin requires KindleGento generate Kindle output from DITA maps. To install KindleGen for use by Oxygen XML Developer plugin, follow these steps:

- 1. Go to www.amazon.com/kindleformat/kindlegen and download the zip file that matches your operating system.
- 2. Unzip the file on your local disk.
- 3. Start Oxygen XML Developer plugin and open a DITA map in the DITA Maps Manager view.
- 4. In the **DITA Maps Manager** view, open the Configure Transformation Scenario(s) dialog box.
- 5. Select the **DITA Map Kindle** transformation and press the **Edit** button to edit it.
- **6.** Go to **Parameters** tab and set the **kindlegen.executable** parameter as the path to the *KindleGen* directory.
- 7. Accept the changes.

Migrating OOXML Documents to DITA

Oxygen XML Developer plugin integrates the entire DITA for Publishers plugins suite, enabling you to migrate content from Open Office XML documents to DITA:

- Open an OOXML document in Oxygen XML Developer plugin. The document is opened in the Archive Browser view.
- From the **Archive Browser**, open document.xml.

Note: document.xml holds the content of the document.

• Click Configure Transformation Scenario(s) on the toolbar and apply the DOCX DITA scenario. If you encounter any issues with the transformation, click the link below for further details about the Word to DITA Transformation Framework.

DITA Map Templates

The default templates available for DITA maps are stored in [OXYGEN_DIR]/frameworks/dita/templates/map folder.

Here are some of the DITA map templates available when creating *new documents from templates*:

- **DITA Map Bookmap** New DITA Bookmap.
- **DITA Map Map** New DITA map.
- DITA Map Learning Map New DITA learning and training content specialization map.
- DITA Map Learning Bookmap New DITA learning and training content specialization bookmap.
- DITA Map Eclipse Map IBM specialization of DITA map used for producing Eclipse Help plugins.

DITA for Publishers Map specialization templates:

- **D4P Map** New DITA for Publishers map.
- **D4P Pub-component-map** New DITA for Publishers pub-component-map.
- **D4P Pubmap** New DITA for Publishers pubmap.

The XHTML Document Type

The Extensible HyperText Markup Language (XHTML), is a markup language that has the same depth of expression as HTML, but also conforms to XML syntax.

A file is considered to be a XHTML document when the root element name is html.

Default schemas that are used if one is not detected in the XHTML file are stored in the following locations:

- XHTML 1.0 [OXYGEN_DIR]/frameworks/xhtml/dtd/or [OXYGEN_DIR]/frameworks/xhtml/nvdl/.
- XHTML 1.1 [OXYGEN_DIR]/frameworks/xhtml11/dtd/or [OXYGEN_DIR]/frameworks/xhtml11/schema/.
- XHTML 5 [OXYGEN_DIR]/frameworks/xhtml/xhtml5 (epub3)/.

The default catalogs for the XHTML document type are as follows:

- [OXYGEN_DIR]/frameworks/xhtml/dtd/xhtmlcatalog.xml
- [OXYGEN_DIR]/frameworks/relaxng/catalog.xml
- [OXYGEN_DIR]/frameworks/nvdl/catalog.xml
- [OXYGEN_DIR]/frameworks/xhtml11/dtd/xhtmlcatalog.xml
- [OXYGEN_DIR]/frameworks/xhtml11/schema/xhtmlcatalog.xml
- [OXYGEN_DIR]/xhtml5 (epub3)/catalog-compat.xml

XHTML Transformation Scenarios

The following default transformation scenarios are available for XHTML:

- XHTML to DITA concept Converts an XHTML document to a DITA concept document.
- XHTML to DITA reference Converts an XHTML document to a DITA reference document.
- XHTML to DITA task Converts an XHTML document to a DITA task document.
- XHTML to DITA topic Converts an XHTML document to a DITA topic document.

XHTML Templates

Default templates are available for XHTML. They are stored in <code>[OXYGEN_DIR]/frameworks/xhtml/templates</code> folder and they can be used for easily creating basic XHTML documents.

Here are some of the XHTML templates available when creating *new documents from templates*.

- XHTML 1.0 Strict New Strict XHTML 1.0
- XHTML 1.0 Transitional New Transitional XHTML 1.0
- XHTML 1.1 DTD Based New DTD based XHTML 1.1
- XHTML 1.1 DTD Based + MathML 2.0 + SVG 1.1 New XHTML 1.1 with MathML and SVG insertions
- XHTML 1.1 Schema based New XHTML 1.1 XML Schema based

The TEI ODD Document Type

The **Text Encoding Initiative - One Document Does it all** (*TEI ODD*) is a TEI XML-conformant specification format that allows you to create a custom TEI P5 schema in a literate programming fashion. A system of XSLT stylesheets called *Roma* was created by the TEI Consortium for manipulating the ODD files.

A file is considered to be a TEI ODD document when the following conditions are true:

- The file extension is .odd.
- The document namespace is http://www.tei-c.org/ns/1.0.

The default schema that is used if one is not detected in the TEI ODD document is tei_odds.rng and it is stored in [OXYGEN_DIR]/frameworks/tei/xml/tei/custom/schema/relaxng/.

The default catalogs for the TEI ODD document type are as follows:

- [OXYGEN DIR]/frameworks/tei/xml/tei/custom/schema/catalog.xml
- [OXYGEN_DIR]/frameworks/tei/xml/tei/schema/catalog.xml

TEI ODD Transformation Scenarios

The following default transformations are available:

- TEI ODD XHTML Transforms a TEI ODD document into an XHTML document
- TEI ODD PDF Transforms a TEI ODD document into a PDF document using the Apache FOP engine
- TEI ODD EPUB Transforms a TEI ODD document into an EPUB document
- TEI ODD DOCX Transforms a TEI ODD document into a DOCX document
- TEI ODD ODT Transforms a TEI ODD document into an ODT document
- TEI ODD RelaxNG XML Transforms a TEI ODD document into a RelaxNG XML document
- TEI ODD to DTD Transforms a TEI ODD document into a DTD document
- TEI ODD to XML Schema Transforms a TEI ODD document into an XML Schema document
- TEI ODD to RelaxNG Compact Transforms a TEI ODD document into an RelaxNG Compact document

TEI ODD Templates

There is only one default template which is stored in the <code>[OXYGEN_DIR]/frameworks/tei/templates/TEI</code> ODD folder and can be used for easily creating a basic TEI ODD document. This template is available when creating <code>new documents from templates</code>.

• TEI ODD - New TEI ODD document

The TEI P4 Document Type

The **Text Encoding Initiative** (**TEI**) **Guidelines** is an international and interdisciplinary standard that enables libraries, museums, publishers, and individual scholars to represent a variety of literary and linguistic texts for online research, teaching, and preservation.

A file is considered to be a TEI P4 document when one of the following conditions are true:

- The local name of the root is TEI. 2.
- The public id of the document is -//TEI P4.

The default schema that is used if one is not detected in the TEI P4 document is tei2.dtd and it is stored in [OXYGEN_DIR]/frameworks/tei/xml/teip4/schema/dtd/.

The default catalogs for the TEI P4 document type are as follows:

- [OXYGEN_DIR]/frameworks/tei/xml/teip4/schema/dtd/catalog.xml
- [OXYGEN DIR]/frameworks/tei/xml/teip4/custom/schema/dtd/catalog.xml
- [OXYGEN_DIR]/frameworks/tei/xml/teip4/stylesheet/catalog.xml

TEI P4 Transformation Scenarios

The following default transformations are available:

- **TEI HTML** Transforms a TEI document into a HTML document;
- TEI P4 -> TEI P5 Conversion Convert a TEI P4 document into a TEI P5 document;
- **TEI PDF** Transforms a TEI document into a PDF document using the Apache FOP engine.

TEI P4 Templates

The default templates are stored in <code>[OXYGEN_DIR]/frameworks/tei/templates/TEI P4</code> folder and they can be used for easily creating basic TEI P4 documents. These templates are available when creating <code>new documents from templates</code>.

- TEI P4 Lite New TEI P4 Lite
- TEI P4 New Document New TEI P4 standard document

The TEI P5 Document Type

The **Text Encoding Initiative (TEI) Guidelines** is an international and interdisciplinary standard that enables libraries, museums, publishers, and individual scholars to represent a variety of literary and linguistic texts for online research, teaching, and preservation.

A file is considered to be a TEI P5 document when one of the following conditions are true:

- The document namespace is http://www.tei-c.org/ns/1.0.
- The public id of the document is -//TEI P5.

The default schema that is used if one is not detected in the TEI P5 document is tei_all.rng and it is stored in [OXYGEN_DIR]/frameworks/tei/xml/tei/custom/schema/relaxng/.

The default catalogs for the TEI P5 document type are as follows:

- [OXYGEN_DIR]/frameworks/tei/xml/tei/schema/dtd/catalog.xml
- [OXYGEN_DIR]/frameworks/tei/xml/tei/custom/schema/dtd/catalog.xml
- [OXYGEN_DIR]/frameworks/tei/xml/tei/stylesheet/catalog.xml

To watch our video demonstration about TEI editing, go to http://oxygenxml.com/demo/WYSIWYG_TEI_Editing.html.

TEI P5 Transformation Scenarios

The following default transformations are available:

- TEI P5 XHTML transforms a TEI P5 document into a XHTML document;
- TEI P5 PDF transforms a TEI P5 document into a PDF document using the Apache FOP engine;
- **TEI EPUB** transforms a TEI P5 document into an EPUB output. The EPUB output will contain any images referenced in the TEI XML document;
- **TEI DOCX** transforms a TEI P5 document into a DOCX (OOXML) document. The DOCX document will contain any images referenced in the TEI XML document;
- **TEI ODT** transforms a TEI P5 document into an ODT (ODF) document. The ODT document will contain any images referenced in the TEI XML document.

TEI P5 Templates

The default templates are stored in <code>[OXYGEN_DIR]/frameworks/tei/templates/TEI P5</code> folder and they can be used for easily creating basic TEI P5 documents. These templates are available when creating <code>new documents from templates</code>:

- **TELP5 All** New TELP5 All.
- **TEI P5 Bare** New TEI P5 Bare.
- TEI P5 Lite New TEI P5 Lite.
- TEI P5 Math New TEI P5 Math.

- TEI P5 Speech New TEI P5 Speech.
- **TEI P5 SVG** New TEI P5 with SVG extensions.
- **TEI P5 XInclude** New TEI P5 XInclude aware.

Customization of TEI Frameworks Using the Compiled Sources

The following procedure describes how to update to the latest stable version of TEI Schema and TEI XSL, already integrated in the TEI framework for Oxygen XML Developer plugin.

- **1.** Go to https://code.google.com/p/oxygen-tei/;
- 2. Go to **Downloads**;
- **3.** Download the latest uploaded . zip file;
- 4. Unpack the .zip file and copy its content in the Oxygen XML Developer plugin frameworks folder.

The JATS Document Type

The JATS (NISO Journal Article Tag Suite) document type is a technical standard that defines an XML format for scientific literature.

A file is considered to be a JATS document when the PUBLIC ID of the document contains the string -//NLM//DTD.

Default schemas that are used if one is not detected in the JATS document are stored in [OXYGEN_DIR]/frameworks/jats/O2-DTD/.

The default XML catalog, JATS-catalog-02.xml, is stored in [OXYGEN_DIR]/frameworks/02-DTD/.

JATS Transformation Scenarios

The following default transformation scenario is available for JATS documents:

JATS Preview (simple HTML) - Converts a JATS document to a simple HTML document.

JATS Templates

Default templates are available for JATS documents. They are stored in

[OXYGEN_DIR]/frameworks/jats/templates folder and they can be used for easily creating basic JATS documents.

The default JATS templates that are available when creating *new documents from templates* are as follows:

- Archiving JATS archiving tag set version 1.0.
- **Authoring** JATS authoring tag set version 1.0.
- **Book** JATS book tag set version 1.0.
- **Publishing** JATS publishing tag set version 1.0.

The EPUB Document Type

Three distinct frameworks are supported for the EPUB document type:

- NCX A declarative global navigation definition.
- OCF The Open Container Format (OCF) defines a mechanism by which all components of an Open Publication Structure (OPS) can be combined into a single file system entity.
- **OPF** The Open Packaging Format (OPF) defines the mechanism by which all components of a published work that conforms to the Open Publication Structure (OPS) standard (including metadata, reading order, and navigational information) are packaged in an OPS Publication.

Note: Oxygen XML Developer plugin supports both OPF 2.0 and OPF 3.0.

Document Templates

The default templates for the *NCX* and *OCF* document types are located in the <code>[OXYGEN_DIR]/frameworks/docbook/templates</code> folder.

The default template for the *OPF 2.0* document type is located in the [OXYGEN DIR]/frameworks/docbook/templates/2.0 folder.

The default template for the *OPF 3.0* document type is located in the <code>[OXYGEN_DIR]/frameworks/docbook/templates/3.0</code> folder.

The following EPUB templates are available when creating *new documents from templates*:

- NCX Toc New table of contents.
- OCF Container New container based OCF.
- OCF Encryption New encryption based OCF.
- **OCF Signatures** New signature based OCF.
- **OPF 2.0 Content (2.0)** New OPF 2.0 content.
- **OPF 3.0 Content (3.0) New OPF 3.0 content.**

The DocBook Targetset Document Type

DocBook Targetset documents are used to resolve cross references with the DocBook olink.

A file is considered to be a *Targetset* when the root name is targetset.

The default schema, targetdatabase.dtd, for this type of document is stored in [OXYGEN_DIR]/frameworks/docbook/xsl/common/.

Document Templates

The default template for DocBook *Targetset* documents is located in the [OXYGEN_DIR]/frameworks/docbook/templates/Targetset folder.

The following DocBook *Targetset* template is available when creating *new documents from templates*:

• **DocBook Targetset - Map** - New Targetset map.

Transforming Documents

Topics:

- Transformation Scenarios
- Output Formats

XML documents can be transformed into a variety of user-friendly output formats that can be viewed by other users. This process is known as a *transformation*.

A transformation scenario is a set of complex operations and settings that gives you the possibility to obtain outputs of multiple types (XML, HTML, PDF, EPUB, etc.) from the same source of XML files and stylesheets.

Executing a transformation scenario implies multiple actions, such as:

- Validating the input file.
- Obtaining intermediate output files (for example, formatting objects for the XML to PDF transformation).
- Using transformation engines to produce the output.

Before transforming an XML document in Oxygen XML Developer plugin, you need to define a transformation scenario to apply to that document. A scenario is a set of values for various parameters that define a transformation. It is not related to a particular document, but rather to a document type. Types of transformation scenarios include:

- Scenarios that Apply to XML Files This type of scenario contains the location of an XSLT stylesheet that is applied on the edited XML document, as well as other transformation parameters.
- Scenarios that Apply to XSLT Files This type of scenario contains the location of an XML document, on which the edited XSLT stylesheet is applied, as well as other transform parameters.
- Scenarios that Apply to XQuery Files This type of scenario contains the location of an XML source, on which the edited XQuery file is applied, as well as other transform parameters. When the XML source is a native XML database, the XML source field of the scenario is empty because the XML data is read with XQuery-specific functions, such as document(). When the XML source is a local XML file, the URL of the file is specified in the XML input field of the scenario.
- Scenarios that Apply to SQL Files This type of scenario specifies a database connection for the database server
 that runs the SQL file that is associated with the scenario. The data processed by the SQL script is located in the
 database.
- Scenarios that Apply to XProc Files This type of scenario contains the location of an XProc script, as well as
 other transform parameters.
- **DITA-OT Scenarios** This type of scenario provides the parameters for an Ant transformation that executes a DITA-OT build script. Oxygen XML Developer plugin comes with a built-in version of Ant and a built-in version of DITA-OT, although you can also set other versions in the scenario.
- **ANT Scenarios** This type of scenario contains the location of an Ant build script, as well as other transform parameters.

Note:

Status messages generated during the transformation process are displayed in the Console view.

Defining a New Transformation Scenario

Defining a transformation scenario is the first step in the process of transforming a document. The following types of scenarios are available:

- XML Transformation with XSLT Specifies the transformation parameters and location of an XSLT stylesheet that
 is applied to the edited XML document. This scenario is useful when you develop an XML document and the XSLT
 document is in its final form.
- XML Transformation with XQuery Specifies the transform parameters and location of an XQuery file that is
 applied to the edited XML document.
- *DITA-OT Transformation* Specifies the parameters for an Ant transformation that executes a DITA-OT build script. Oxygen XML Developer plugin comes with a built-in version of Ant and a built-in version of DITA-OT but different versions can be set in the scenario.
- ANT Transformation Allows you to configure the options and parameters of an Ant build script.
- XSLT Transformation Specifies the transformation parameters and location of an XML document to which the
 edited XSLT stylesheet is applied. This scenario is useful when you develop an XSLT document and the XML
 document is in its final form.
- XProc Transformation Specified the transformation parameters and location of an XProc script.

- XQuery Transformation -Specifies the transformation parameters and location of an XML source to which the edited XQuery file is applied. When the XML source is a native XML database, the XML source field of the scenario is empty because the XML data is read with XQuery-specific functions, such as document(). When the XML source is a local XML file, the URL of the file is specified in the XML input field of the scenario.
- **SQL Transformation** Specifies a database connection for the database server that runs the SQL file associated with the scenario. The data processed by the SQL script is located in the database.

XML Transformation with XSLT

To create an XML transformation with XSLT scenario, use one of the following methods:

- Go to **Window** > **Show View** and select **Transformation Scenarios** to display this view. Click the **New** button and select **XML transformation with XSLT**.
- Use the Configure Transformation Scenario(s) (<u>Alt + Shift + T, C (Meta + Alt + T, C on OS X)</u>) action from the **Transformation** toolbar or the **XML** menu. Then click the **New** button and select **XML transformation** with **XSLT**.
- Use the Papply Transformation Scenario(s) (Alt + Shift + T, T (Meta + Alt + T, T on OS X)) action from the Transformation toolbar or the XML menu. Then click the New button and select XML transformation with XSLT.
 - Note: If a scenario is already associated with the edited document, selecting Apply Transformation Scenario(s) runs the associated scenario automatically. You can check whether transformation scenarios are associated with the edited document by hovering your cursor over the Apply Transformation Scenario button.

All three methods open the **New Scenario** dialog box. This dialog box allows you to configure the options that control the transformation.

The dialog box contains the following tabs:

- *XSLT*.
- FO Processors.
- Output.

The XSLT Tab

The **XSLT** tab contains the following options:

- **XML URL** Specifies the source XML file. This URL is resolved through the catalog resolver. If the catalog does not have a mapping for the URL, then the file is used directly from its remote location.
 - Note: If the transformer engine is Saxon 9 and a custom URI resolver is configured in **Preferences** for Saxon 9, the XML input of the transformation is passed to that URI resolver.
 - Note: If the transformer engine is one of the built-in XSLT 2.0 / 3.0 engines and *the name of an initial template* is specified in the scenario, the **XML URL** field can be empty. The **XML URL** field can also be empty if you use *external XSLT processors*. Otherwise, a value is mandatory in the **XML URL** field.
- **XSL URL** Specifies the source XSL file that the transformation will use. This URL is resolved through the catalog resolver. If the catalog does not have a mapping for the URL, the file is used directly from its remote location.

You can use the following browsing buttons to enter values in the XML URL and XSL URL fields:

Insert Editor Variables

Opens a pop-up menu allowing you to introduce special *Oxygen XML Developer plugin editor variables* or *custom editor variables* in the XML URL field.

Browse for local file

Opens a local file browser dialog box allowing you to select a local file.

Opens a file browser dialog box allowing you to select a file from the local workspace.

Browse for remote file

Opens an URL browser dialog box allowing you to select a remote file.

Browse for archived file

Opens a zip archive browser dialog box allowing you to select a file from a zip archive.

Browse Data Source Explorer

Opens the **Data Source Explorer** window.

Search for file

Allows you to find a file in the current project.

The rest of the options available in the **XSLT** tab allow you to further customize the transformation scenario:

- Use "xml-stylesheet" declaration Use the stylesheet declared with an xml-stylesheet declaration instead of the stylesheet specified in the XSL URL field. By default, this checkbox is not selected and the transformation applies the XSLT stylesheet that is specified in the XSL URL field. If it is checked, the scenario applies the stylesheet specified explicitly in the XML document with the xml-stylesheet processing instruction.
- **Transformer** This drop-down menu presents all the transformation engines available to Oxygen XML Developer plugin for performing a transformation. These are the built-in engines and *the external engines defined in the Custom Engines preferences page*. The engine you choose in this dialog box is used as the default transformation engine. Also, if an XSLT or XQuery document does not have an associated validation scenario, this transformation engine is used in the validation process (if it provides validation support).
 - Advanced options Allows you to configure the advanced options of the Saxon HE / PE / EE engine for the current transformation scenario. To configure the same options globally, go to the Saxon-HE/PE/EE preferences page. For the current transformation scenario, these Advanced options override the options configured in the Saxon-HE/PE/EE preferences page. The Initial mode and template option is only available in the Advanced options. It is a Saxon-specific option that sets the name of the first XSLT template that starts the XSLT transformation or the initial mode of the transformation.
- Parameters Opens the Configure parameters dialog box, allowing you to configure the XSLT parameters used
 in the current transformation. In this dialog box, you can also configure the parameters of additional stylesheets by
 using the Additional XSLT stylesheets button. If the XSLT transformation engine is custom-defined, you can not
 use this dialog box to configure the parameters sent to the custom engine. Instead, you can copy all parameters from
 the dialog box using contextual menu actions and edit the custom XSLT engine to include the necessary parameters
 in the command line that starts the transformation process.
- Extensions Opens the dialog box for configuring the XSLT/XQuery extension jars or classes that define extension Java functions or extension XSLT elements used in the transformation.
- Additional XSLT stylesheets Opens the dialog box for adding XSLT stylesheets that are applied on the main stylesheet that is specified in the XSL URL field. This is useful when a chain of XSLT stylesheets must be applied to the input XML document.

Configure XSLT Parameters

The global parameters of the XSLT stylesheet used in a transformation scenario can be configured by using the **Parameters** button in the **XSLT** tab of a new or edited transformation scenario dialog box.

The table displays all the parameters of the current XSLT stylesheet, all imported and included stylesheets, and all *additional stylesheets*, along with their descriptions and current values. You can also add, edit, and remove parameters. Use the **Filter** text box to search for a specific term in the entire parameters collection. Note that edited parameters are displayed with the name in bold.

If the **XPath** column is checked, the parameter value is evaluated as an XPath expression before starting the XSLT transformation.

For example, you can use expressions such as:

```
doc('test.xml')//entry
//person[@atr='val']
```

Note:

- 1. The doc function solves the argument relative to the XSL stylesheet location. You can use full paths or editor variables (such as $\{cfdu\}$ [current file directory]) to specify other locations: doc('\${cfdu}/test.xml')//*
- 2. You cannot use XSLT Functions. Only XPath functions are allowed.

The following actions are available for managing the parameters:

New

Opens the Add Parameter dialog box that allows you to add a new parameter to the list. An editor variable can be inserted in the text box using the 🊣 Insert Editor Variables button. If the Evaluate as XPath option is enabled, the parameter will be evaluated as an XPath expression.

Edit

Opens the Edit Parameter dialog box that allows you to edit the selected parameter. An editor variable can be inserted in the text box using the . Insert Editor Variables button. If the Evaluate as XPath option is enabled, the parameter will be evaluated as an XPath expression.

Unset

Resets the selected parameter to its default value. Available only for edited parameters with set values.

Delete

Removes the selected parameter from the list. It is enabled only for new parameters that have been added to the list.

The bottom panel presents the following:

- The default value of the parameter selected in the table.
- A description of the parameter, if available.
- The system ID of the stylesheet that declares it.

XSLT/XQuery Extensions

The **Libraries** dialog box is used to specify the jars and classes that contain extension functions called from the XSLT or XQuery file of the current transformation scenario. You can use the Add, Edit, and Remove buttons to configure the extensions.

An extension function called from the XSLT or XQuery file of the current transformation scenario will be searched, in the specified extensions, in the order displayed in this dialog box. To change the order of the items, select the item to be moved and press the ↑ Move up or ↓ Move down buttons.

The FO Processor Tab

The **FO Processor** tab contains the following options:

- Perform FO Processing Specifies whether an FO processor is applied (either the built-in Apache FOP engine or an external engine defined in **Preferences**) during the transformation.
- **XSLT result as input** The FO processor is applied to the result of the XSLT transformation that is defined in the
- XML URL as input The FO processor is applied to the input XML file.
- Method The output format of the FO processing. Available options depend on the selected processor type.
- **Processor** Specifies the FO processor. It can be the built-in Apache FOP processor or an *external processor*.

The Output Tab

The **Output** tab contains the following options:

- **Prompt for file** At the end of the transformation, a file browser dialog box is displayed for specifying the path and name of the file that stores the transformation result.
- Save As The path of the file where the result of the transformation is stored.
- Open in Browser/System Application If enabled, Oxygen XML Developer plugin automatically opens the result
 of the transformation in a system application associated with the file type of the result (for example, .pdf files are
 usually opened in the Acrobat Reader application).
 - 島

Note: To set the web browser that is used for displaying HTML/XHTML pages, *open the Preferences dialog box*, then go to **General** > **Web Browser**.

- Saved file When Open in Browser/System Application is selected, this button can be used to specify that Oxygen XML Developer plugin automatically opens the file specified in the Save As text field at the end of the transformation.
- Other location When Open in System Application is selected, this option can be used to specify that Oxygen XML Developer plugin opens the file specified here.
- **Open in editor** When this is enabled, the transformation result specified in the **Save As** field is opened in a new editor panel with the appropriate built-in editor type (for example, if the result is an XML file it is opened in the built-in XML editor, or if it is an XSL-FO file it is opened with the built-in FO editor).
- Show in results view as
 - XHTML Can only be enabled if Open in Browser/System Application is disabled. If this is checked, Oxygen
 XML Developer plugin displays the transformation result in a built-in XHTML browser panel at the bottom of
 the application window.
 - Important: When transforming very large documents, you should be aware that enabling this feature results in a very long processing time, necessary for rendering the transformation result in the XHTML result viewer panel. This drawback is due to the built-in Java XHTML browser implementation. To avoid delays for large documents, if you want to see the XHTML result of the transformation, you should use an external browser by checking the **Open in browser** option.
 - **XML** If this is checked, Oxygen XML Developer plugin displays the transformation result in an XML viewer panel at the bottom of the application window with *syntax highlighting*, specific for XML documents.
- Image URLs are relative to If Show in results view as XHTML is checked, this text field specifies the path used to resolve image paths contained in the transformation result.

The Oxygen XML Developer plugin Browser View

The Oxygen XML Developer plugin Browser view is automatically displayed in the views pane of the Eclipse window to display HTML output from XSLT transformations. It contains a tab for each file with HTML results displayed in the view.

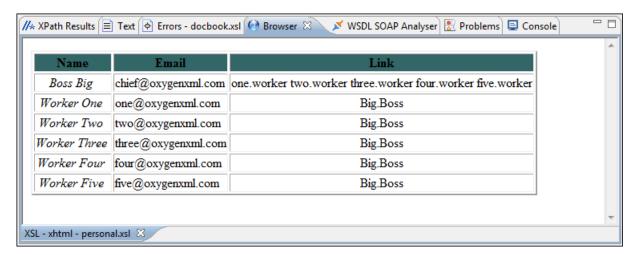

Figure 176: The Browser View

The Oxygen XML Developer plugin Text View

The Oxygen XML Developer plugin **Text** view is automatically displayed in the views pane of the Eclipse window to display text output from XSLT transformations, FO processor info, warnings, and error messages. It contains a tab for each file with text results displayed in the view.

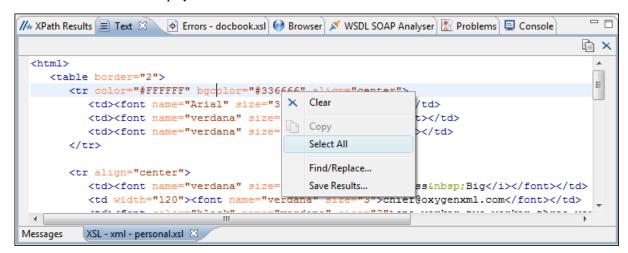

Figure 177: The Text View

Additional XSLT Stylesheets

The list of additional XSLT stylesheets can be edited in the dialog box opened by the **Additional XSLT Stylesheets** button in the **XSLT** tab of a new or edited transformation scenario dialog box. The following actions are available:

Add

Adds a stylesheet in the **Additional XSLT stylesheets** list using a file browser dialog box. You can type an *editor variable* in the file name field of the browser dialog box. The name of the stylesheet will be added in the list after the current selection.

Remove

Deletes the selected stylesheet from the Additional XSLT stylesheets list.

Up

Moves the selected stylesheet up in the list.

Down

Moves the selected stylesheet down in the list.

XML Transformation with XQuery

Use the **XML transformation with XQuery** scenario to apply a transformation in which an XQuery file queries an XML file for the output results.

To create an XML transformation with XQuery scenario, use one of the following methods:

- Go to Window > Show View and select Transformation Scenarios to display this view. Click the New button and select XML transformation with XOuery.
- Use the Configure Transformation Scenario(s) (Alt + Shift + T, C (Meta + Alt + T, C on OS X)) action from the Transformation toolbar or the XML menu. Then click the New button and select XML transformation with XQuery.
- Use the Apply Transformation Scenario(s) (Alt + Shift + T, T (Meta + Alt + T, T on OS X)) action from
 the Transformation toolbar or the XML menu. Then click the New button and select XML transformation with
 XQuery.
 - =

Note: If a scenario is already associated with the edited document, selecting **Apply Transformation Scenario(s)** runs the associated scenario automatically. You can check whether transformation scenarios are

associated with the edited document by hovering your cursor over the Apply Transformation Scenario button.

All three methods open the **New Scenario** dialog box. This dialog box allows you to configure the options that control the transformation.

The dialog box contains the following tabs:

- XOuery.
- FO Processor.
- Output.

The XQuery Tab

The **XQuery** tab contains the following options:

- **XML URL** Specifies the source XML file. This URL is resolved through the catalog resolver. If the catalog does not have a mapping for the URL, then the file is used directly from its remote location.
 - Note: If the transformer engine is Saxon 9 and a custom URI resolver is configured in **Preferences** for Saxon 9, the XML input of the transformation is passed to that URI resolver.
- XQuery URL specifies the source XQuery file that the transformation will use. This URL is resolved through the
 catalog resolver. If the catalog does not have a mapping for the URL, the file is used directly from its remote location.

You can use the following browsing buttons to enter values in the XML URL and XQuery URL fields:

Insert Editor Variables

Opens a pop-up menu allowing you to introduce special Oxygen XML Developer plugin editor variables or custom editor variables in the XML URL field.

Browse for local file

Opens a local file browser dialog box allowing you to select a local file.

Browse workspace

Opens a file browser dialog box allowing you to select a file from the local workspace.

Browse for remote file

Opens an URL browser dialog box allowing you to select a remote file.

Browse for archived file

Opens a zip archive browser dialog box allowing you to select a file from a zip archive.

Browse Data Source Explorer

Opens the **Data Source Explorer** window.

Search for file

Allows you to find a file in the current project.

The rest of the options available in the **XQuery** tab allow you to further customize the transformation scenario:

- **Transformer** This drop-down menu presents all the transformation engines available to Oxygen XML Developer plugin for performing a transformation. These are the built-in engines and *the external engines defined in the Custom Engines preferences page*. The engine you choose in this dialog box is used as the default transformation engine. Also, if an XSLT or XQuery document does not have an associated validation scenario, this transformation engine is used in the validation process (if it provides validation support).;
 - **Advanced options** configure advanced options specific for the Saxon HE / PE / EE engine.
- Parameters Opens the Configure parameters dialog box for configuring the XQuery parameters. You can use buttons in this dialog box you can add, edit, or remove parameters. If the XQuery transformation engine is custom-defined you can not use this dialog box to set parameters. Instead, you can copy all parameters from the

dialog box using contextual menu actions and edit the custom XQuery engine to include the necessary parameters in the command line that starts the transformation process.

Note: Use the **Filter** text box to search for a specific term in the entire parameters collection.

• Extensions - Opens *the dialog box for configuring the XSLT/XQuery extension jars or classes* that define extension Java functions or extension XSLT elements used in the transformation.

XSLT/XQuery Extensions

The **Libraries** dialog box is used to specify the jars and classes that contain extension functions called from the XSLT or XQuery file of the current transformation scenario. You can use the **Add**, **Edit**, and **Remove** buttons to configure the extensions.

An extension function called from the XSLT or XQuery file of the current transformation scenario will be searched, in the specified extensions, in the order displayed in this dialog box. To change the order of the items, select the item to be moved and press the Move up or Move down buttons.

The FO Processor Tab

The **FO Processor** tab contains the following options:

- **Perform FO Processing** Specifies whether an FO processor is applied (either the built-in Apache FOP engine or an external engine defined in **Preferences**) during the transformation.
- **XQuery result as input** the FO processor is applied to the result of the XQuery transformation defined in the **XQuery** tab.
- XML URL as input The FO processor is applied to the input XML file.
- Method The output format of the FO processing. Available options depend on the selected processor type.
- **Processor** Specifies the FO processor. It can be the built-in Apache FOP processor or an *external processor*.

The Output Tab

The **Output** tab contains the following options:

- **Present as a sequence** Enabling this option will reduce the time necessary to fetch the full result, as it will only fetch the first chunk of the result.
- **Prompt for file** At the end of the transformation, a file browser dialog box is displayed for specifying the path and name of the file that stores the transformation result.
- Save As The path of the file where the result of the transformation is stored.
- **Open in Browser/System Application** If enabled, Oxygen XML Developer plugin automatically opens the result of the transformation in a system application associated with the file type of the result (for example, .pdf files are usually opened in the *Acrobat Reader* application).

Note: To set the web browser that is used for displaying HTML/XHTML pages, *open the Preferences dialog box*, then go to **General** > **Web Browser**.

- Saved file When Open in Browser/System Application is selected, this button can be used to specify that Oxygen XML Developer plugin automatically opens the file specified in the Save As text field at the end of the transformation.
- Other location When Open in System Application is selected, this option can be used to specify that Oxygen XML Developer plugin opens the file specified here.
- Open in editor When this is enabled, the transformation result specified in the Save As field is opened in a new editor panel with the appropriate built-in editor type (for example, if the result is an XML file it is opened in the built-in XML editor, or if it is an XSL-FO file it is opened with the built-in FO editor).
- Show in results view as
 - XHTML Can only be enabled if **Open in Browser/System Application** is disabled. If this is checked, Oxygen XML Developer plugin displays the transformation result in a built-in XHTML browser panel at the bottom of the application window.

- (!)
- **Important:** When transforming very large documents, you should be aware that enabling this feature results in a very long processing time, necessary for rendering the transformation result in the XHTML result viewer panel. This drawback is due to the built-in Java XHTML browser implementation. To avoid delays for large documents, if you want to see the XHTML result of the transformation, you should use an external browser by checking the **Open in browser** option.
- **XML** If this is checked, Oxygen XML Developer plugin displays the transformation result in an XML viewer panel at the bottom of the application window with *syntax highlighting*, specific for XML documents.
- Image URLs are relative to If Show in results view as XHTML is checked, this text field specifies the path used to resolve image paths contained in the transformation result.

DITA OT Transformation

To create a **DITA OT Transformation** scenario, use one of the following methods:

- Go to Window > Show View and select Transformation Scenarios to display this view. Click the New button and select DITA OT Transformation.
- Use the Configure Transformation Scenario(s) (<u>Alt + Shift + T, C (Meta + Alt + T, C on OS X)</u>) action from the Transformation toolbar or the XML menu. Then click the New button and select DITA OT Transformation.
- Use the Apply Transformation Scenario(s) (Alt + Shift + T, T (Meta + Alt + T, T on OS X)) action from the Transformation toolbar or the XML menu. Then click the New button and select DITA OT Transformation.
 - Note: If a scenario is already associated with the edited document, selecting Apply Transformation Scenario(s) runs the associated scenario automatically. You can check whether transformation scenarios are associated with the edited document by hovering your cursor over the Apply Transformation Scenario button.

All three methods open the **DITA Transformation Type** dialog box that presents the list of possible outputs.

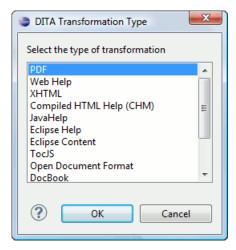

Figure 178: DITA Transformation Type Dialog Box

Select the desired type of output and click **OK**. This opens the **New Scenario** dialog box, which allows you to configure the options that control the transformation.

The lower part of the dialog box contains the following tabs (only those that are appropriate for the chosen output type will be displayed):

- Skins (Available for WebHelp and WebHelp with Feedback output types).
- FO Processor (Available for PDF output types).
- Parameters

- Filters
- Advanced
- Output

The Skins Tab

A *skin* is a collection of CSS properties that can alter the look of the output by changing colors, font types, borders, margins, and paddings. This allows you to rapidly adapt the look and feel of the output for your organization.

Oxygen XML Developer plugin provides a set of predefined *skins* for the **DITA Map WebHelp** and **DITA Map WebHelp** with **Feedback** transformation scenarios.

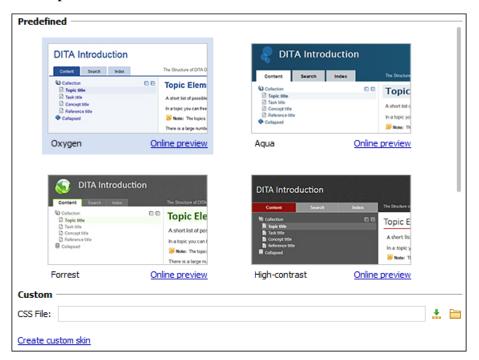

Figure 179: The Skins Tab

The predefined skins cover a wide range of chromatic themes, ranging from a very light one to a high-contrast variant. By default, the *Oxygen* skin is selected (notice the light blue border around the skin preview). If you want to obtain an output without any customization, deselect the currently selected skin.

To see how the *skin* looks when applied on a sample documentation project that is stored on the Oxygen XML Developer plugin website, press the **Online preview** link.

Note: Press the Create custom skin link to open the WebHelp Skin Builder tool.

To further customize the look of the output, set the **CSS File** field to point to your custom CSS stylesheet or to a customized skin.

Note: A custom CSS file will overwrite a skin selection.

Note: The output can also be styled by setting the args.css parameter in the **Parameters tab**. The properties taken from the stylesheet referenced in this parameter take precedence over the properties declared in the skin set in the **Skins tab**.

The FO Processor Tab

This tab allows you to select an FO Processor, when you choose to generate PDF output.

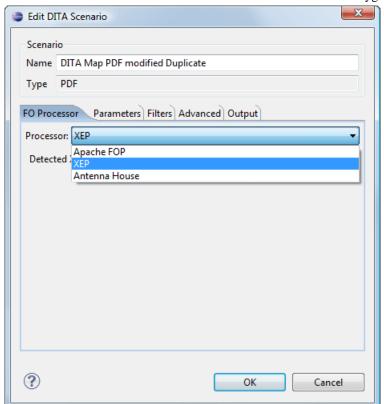

Figure 180: FO Processor Configuration Tab

You can choose the following processors:

- Apache FOP The default processor that comes bundled with .
- XEP The RenderX XEP processor.

If XEP is already installed, displays the detected installation path under the drop-down menu.

XEP is considered installed if it was detected in one of the following sources:

- XEP was configured as an external FO Processor in the FO Processors option page.
- The system property *com.oxygenxml.xep.location* was set to point to the XEP executable file for the platform (for example: xep.bat on Windows).
- XEP was installed in the /plugins/org.dita.pdf2/lib directory of the installation directory.
- Antenna House The *Antenna House* (AH Formatter) processor.

If Antenna House is already installed, displays the detected installation path under the drop-down menu.

Antenna House is considered installed if it was detected in one of the following sources:

- Environment variable set by Antenna House installation (the newest installation version will be used).
- Antenna House was added as an external FO Processor in the preferences pages.

To further customize the PDF output obtained from the Antenna House processor:

- Edit the transformation scenario.
- Open the *Parameters tab*.
- Add the env. AXF_OPT parameter and point to Antenna House configuration file.

The Parameters Tab

The Parameters tab allows you to configure the parameters sent to the DITA-OT build file.

The table displays all the parameters that the DITA-OT documentation specifies as available for each chosen type of transformation (for example: XHTML or PDF), along with their description and current values. You can find more information about each parameter in the *DITA OT Documentation*. You can also add, edit, and remove parameters. Use the **Filter** text box to search for a specific term in the entire parameters collection. Note that edited parameters are displayed with the name in bold.

Depending on the type of a parameter, its value can be one of the following:

- A simple text field for simple parameter values.
- A combo box with some predefined values.
- A file chooser and an editor variable selector to simplify setting a file path as the value of a parameter.

Note: To input parameter values at runtime, use the *ask editor variable* in the **Value** column.

The following actions are available for managing parameters:

New

Opens the **Add Parameter** dialog box that allows you to add a new parameter to the list. An *editor variable* can be inserted in the text box using the ... **Insert Editor Variables** button.

Edit

Opens the **Edit Parameter** dialog box that allows you to change the value of the selected parameter by selecting it from a list of allowed values.

Unset

Resets the selected parameter to its default value. Available only for edited parameters with set values.

Delete

Removes the selected parameter from the list. It is enabled only for new parameters that have been added to the list.

The Filters Tab

The Filters tab allows you to add filters to remove certain content elements from the generated output.

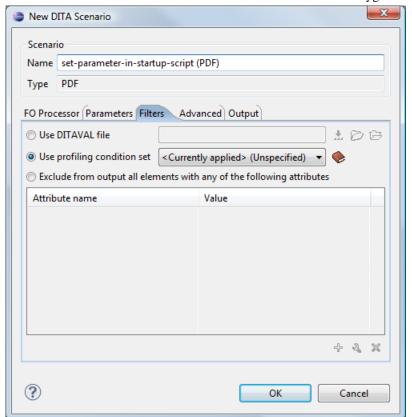

Figure 181: Edit Filters tab

There are three ways to define filters:

- Use DITAVAL file If you already have a DITAVAL file associated with the DITA map, you can specify the file to be used when filtering content. An *editor variable* can be inserted for the file path by using the ... Insert Editor Variables button. You can find out more about constructing a DITAVAL file in the *DITA OT Documentation*.
- Exclude from output all elements with any of the following attributes By using the New, Edit, or

 * Delete buttons at the bottom of the pane, you can configure a list of attributes (name and value) to exclude all elements that contain any of these attributes from the output.

The Advanced Tab

The **Advanced** tab allows you to specify advanced options for the transformation scenario.

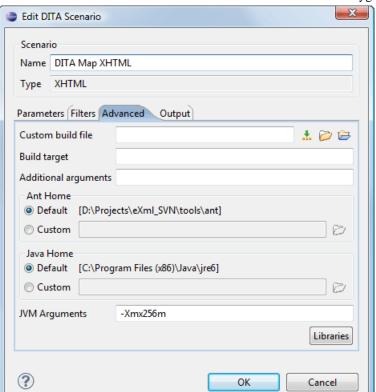

Figure 182: Advanced Settings Tab

You can specify the following parameters:

- Custom build file If you use a custom DITA-OT build file, you can specify the path to the customized build file. If empty, the build.xml file from the *dita.dir* parameter that is configured in the **Parameters** tab is used. An *editor variable* can be inserted for the file path by using the ... Insert Editor Variables button.
- **Build target** Optionally, you can specify a build target for the build file. If no target is specified, the default init target is used.
- Additional arguments You can specify additional command-line arguments to be passed to the Ant transformation (such as -verbose).
- Ant Home You can choose between the default or custom Ant installation to run the transformation.
- **Java Home** You can choose between the default or custom Java installation to run the transformation. The default path is the Java installation that is used by Oxygen XML Developer plugin.

Note: It may be possible that the used Java version is incompatible with the DITA Open Toolkit engine. For example, DITA OT 1.8.5 and older requires Java 1.6 or later, while DITA OT 2.0 and newer requires Java 1.7 or newer. Thus, if you encounter related errors running the publishing, consider installing a Java VM that is supported by the DITA OT publishing engine and using it in the **Java Home** text field.

- **JVM Arguments** This parameter allows you to set specific parameters for the Java Virtual Machine used by Ant. For example, if it is set to -Xmx384m, the transformation process is allowed to use 384 megabytes of memory. When performing a large transformation, you may want to increase the memory allocated to the Java Virtual Machine. This will help avoid Out of Memory error messages (**OutOfMemoryError**).
- **Libraries** By default, Oxygen XML Developer plugin adds (as high priority) libraries that are not transformation-dependent and also patches for certain DITA Open Toolkit bugs. You can use this button to specify additional libraries (jar files or additional class paths) to be used by the Ant transformer.

The Output Tab

The **Output** tab allows you to configure options that are related to the location where the output is generated.

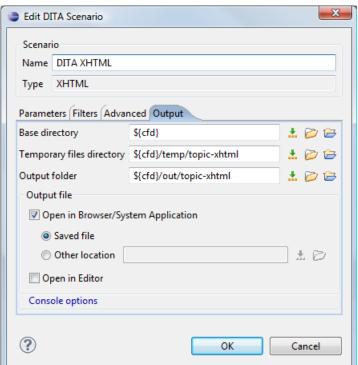

Figure 183: Output Settings Tab

You can specify the following parameters:

- **Base directory** All the relative paths that appear as values in parameters are considered relative to the base directory. The default value is the directory where the transformed map is located. An *editor variable* can be inserted for the path by using the **! Insert Editor Variables** button.
- **Temporary files directory** This directory is used to store pre-processed temporary files until the final output is obtained. An *editor variable* can be inserted for the path by using the ... **Insert Editor Variables** button.
- Output folder The folder where the content of the final output is stored. An *editor variable* can be inserted for the path by using the ... Insert Editor Variables button.
 - **Note:** If the DITA map or topic is opened from a remote location or a ZIP file, the parameters must specify absolute paths.
- Open in Browser/System Application If enabled, Oxygen XML Developer plugin automatically opens the result of the transformation in a system application associated with the file type of the result (for example, .pdf files are usually opened in the *Acrobat Reader* application).
 - Note: To set the web browser that is used for displaying HTML/XHTML pages, *open the Preferences dialog box*, then go to General > Web Browser.
 - Saved file When Open in Browser/System Application is selected, this button can be used to specify that Oxygen XML Developer plugin automatically opens the file specified in the Save As text field at the end of the transformation.
 - Other location When Open in System Application is selected, this option can be used to specify that Oxygen XML Developer plugin opens the file specified here.

Troubleshooting DITA Transformation Errors

If a DITA transformation results in errors or warnings, the information is displayed in the message panel at the bottom of the editor. The information includes the severity, description of the problem, the name of the resource, and the path of the resource.

To help prevent and solve DITA transformation problems, follow these steps:

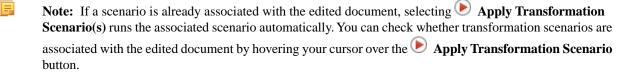

- 1. Validate your DITA documents by using the Validate action from the Validation toolbar drop-down menu, the XML menu, or from the Validate menu when invoking the contextual menu in the Navigator view.
- **2.** If this action results in validation errors, solve them prior to executing the transformation. Also, you should pay attention to the warning messages because they may identify problems in the transformation.
- 3. Run the DITA transformation scenario.
- **4.** If the transformation results in errors or warnings, they are displayed in the **Transformation problems** message panel at the bottom of the editor. The following information is presented to help you troubleshoot the problems:
 - Severity The first column displays the following icons that indicate the severity of the problem:
 - Informational The transformation encountered a condition of which you should be aware.
 - **①** Warning The transformation encountered a problem that should be corrected.
 - Error The transformation encountered a more severe problem, and the output is affected or cannot be generated.
 - Info You can click the See More icon to open a web page that contains details about DITA-OT error messages.
 - Description A description of the problem.
 - **Resource** The name of the transformation resource.
 - **System ID** The path of the transformation resource.
- **5.** Use this information or other resources from the online DITA-OT community to solve the transformation problems before re-executing the transformation scenario.

ANT Transformation

An Ant transformation scenario is usually associated with an Ant build script. Oxygen XML Developer plugin runs an Ant transformation scenario as an external process that executes the Ant build script with the built-in Ant distribution (Apache Ant version 1.8.2) that comes with the application, or optionally with a custom Ant distribution configured in the scenario.

To create an Ant transformation scenario, use one of the following methods:

- Go to Window > Show View and select Transformation Scenarios to display this view. Click the New button and select ANT transformation.
- Use the Configure Transformation Scenario(s) (Alt + Shift + T, C (Meta + Alt + T, C on OS X)) action from the Transformation toolbar or the XML menu. Then click the New button and select ANT transformation.
- Use the Apply Transformation Scenario(s) (Alt + Shift + T, T (Meta + Alt + T, T on OS X)) action from the Transformation toolbar or the XML menu. Then click the New button and select ANT transformation.

All three methods open the **New Scenario** dialog box. This dialog box allows you to configure the options that control the transformation.

The dialog box contains the following tabs:

- The **Options** tab.
- The Parameters tab.
- The Output tab.

The **Options** tab allows you to specify the following options:

- Working directory The path of the current directory of the Ant external process. An *editor variable* can be inserted for the file path by using the ... Insert Editor Variables button.
- **Build file** The Ant script file that is the input of the Ant external process. An *editor variable* can be inserted for the file path by using the ... **Insert Editor Variables** button.
- **Build target** Optionally, you can specify a build target for the Ant script file. If no target is specified, the Ant target that is specified as the default in the Ant script file is used.
- Additional arguments You can specify additional command-line arguments to be passed to the Ant transformation (such as -verbose).
- Ant Home You can choose between the default or custom Ant installation to run the transformation.
- **Java Home** You can choose between the default or custom Java installation to run the transformation. The default path is the Java installation that is used by Oxygen XML Developer plugin.
- JVM Arguments This parameter allows you to set specific parameters for the Java Virtual Machine used by Ant.
 For example, if it is set to -Xmx384m, the transformation process is allowed to use 384 megabytes of memory. When performing a large transformation, you may want to increase the memory allocated to the Java Virtual Machine.
 This will help avoid Out of Memory error messages (OutOfMemoryError).
- **Libraries** By default, Oxygen XML Developer plugin adds (as high priority) libraries that are not transformation-dependent and also patches for certain DITA Open Toolkit bugs. You can use this button to specify additional libraries (jar files or additional class paths) to be used by the Ant transformer.

The Parameters Tab

The Parameters tab allows you to configure the parameters that are accessible as Ant properties in the Ant build script.

The table displays all the parameters that are available in the Ant build script, along with their description and current values. You can also add, edit, and remove parameters. Use the **Filter** text box to search for a specific term in the entire parameters collection. Note that edited parameters are displayed with the name in bold.

Depending on the type of a parameter, its value can be one of the following:

- A simple text field for simple parameter values.
- A combo box with some predefined values.
- A file chooser and an *editor variable* selector to simplify setting a file path as the value of a parameter.

Note: To input parameter values at runtime, use the *ask editor variable* in the **Value** column.

The following actions are available for managing parameters:

New

Opens the **Add Parameter** dialog box that allows you to add a new parameter to the list. An *editor variable* can be inserted in the text box using the ... **Insert Editor Variables** button.

Edit

Opens the **Edit Parameter** dialog box that allows you to change the value of the selected parameter by selecting it from a list of allowed values.

Delete

Removes the selected parameter from the list. It is enabled only for new parameters that have been added to the list.

The Output Tab

The **Output** tab contains the following options:

Open - Allows you to specify the file to open automatically when the transformation is finished. Usually, this is the output file of the Ant process. An *editor variable* can be inserted for the path by using the ... Insert Editor Variables button.

- **In System Application** The file specified in the **Open** text box is opened in the system application that is set in the operating system as the default application for that type of file (for example, .pdf files are usually opened in the *Acrobat Reader* application).
- **In Editor** The file specified in the **Open** text box is opened in a new editor panel with the appropriate built-in editor type (for example, if the result is an XML file it is opened in the built-in XML editor).
- The **Show console output** option allows you to specify when to display the console output log. The following options are available:
 - When build fails displays the console output log if the build fails.
 - Always displays the console output log, regardless of whether or not the build fails.

XSLT Transformation

To create an XSLT transformation scenario, use one of the following methods:

- Go to Window > Show View and select Transformation Scenarios to display this view. Click the New button and select XSLT transformation.
- Use the Configure Transformation Scenario(s) (Alt + Shift + T, C (Meta + Alt + T, C on OS X)) action from the Transformation toolbar or the XML menu. Then click the New button and select XSLT transformation.
- Use the Apply Transformation Scenario(s) (Alt + Shift + T, T (Meta + Alt + T, T on OS X)) action from the Transformation toolbar or the XML menu. Then click the New button and select XSLT transformation.
 - Note: If a scenario is already associated with the edited document, selecting Apply Transformation Scenario(s) runs the associated scenario automatically. You can check whether transformation scenarios are associated with the edited document by hovering your cursor over the Apply Transformation Scenario button.

All three methods open the **New Scenario** dialog box. This dialog box allows you to configure the options that control the transformation.

The dialog box contains the following tabs:

- XSLT
- FO Processors
- Output

The XSLT Tab

The **XSLT** tab contains the following options:

- XML URL Specifies the source XML file. This URL is resolved through the catalog resolver. If the catalog does not have a mapping for the URL, then the file is used directly from its remote location.
 - Note: If the transformer engine is Saxon 9 and a custom URI resolver is configured in **Preferences** for Saxon 9, the XML input of the transformation is passed to that URI resolver.
 - Note: If the transformer engine is one of the built-in XSLT 2.0 / 3.0 engines and *the name of an initial template* is specified in the scenario, the XML URL field can be empty. The XML URL field can also be empty if you use *external XSLT processors*. Otherwise, a value is mandatory in the XML URL field.
- **XSL URL** Specifies the source XSL file that the transformation will use. This URL is resolved through the catalog resolver. If the catalog does not have a mapping for the URL, the file is used directly from its remote location.

You can use the following browsing buttons to enter values in the XML URL and XSL URL fields:

Insert Editor Variables

Opens a pop-up menu allowing you to introduce special Oxygen XML Developer plugin editor variables or custom editor variables in the XML URL field.

Opens a local file browser dialog box allowing you to select a local file.

Browse workspace

Opens a file browser dialog box allowing you to select a file from the local workspace.

Browse for remote file

Opens an URL browser dialog box allowing you to select a remote file.

Browse for archived file

Opens a zip archive browser dialog box allowing you to select a file from a zip archive.

Browse Data Source Explorer

Opens the **Data Source Explorer** window.

Search for file

Allows you to find a file in the current project.

The rest of the options available in the **XSLT** tab allow you to further customize the transformation scenario:

- Use "xml-stylesheet" declaration Use the stylesheet declared with an xml-stylesheet declaration instead of the stylesheet specified in the XSL URL field. By default, this checkbox is not selected and the transformation applies the XSLT stylesheet that is specified in the XSL URL field. If it is checked, the scenario applies the stylesheet specified explicitly in the XML document with the xml-stylesheet processing instruction.
- **Transformer** This drop-down menu presents all the transformation engines available to Oxygen XML Developer plugin for performing a transformation. These are the built-in engines and *the external engines defined in the Custom Engines preferences page*. The engine you choose in this dialog box is used as the default transformation engine. Also, if an XSLT or XQuery document does not have an associated validation scenario, this transformation engine is used in the validation process (if it provides validation support).
 - Advanced options Allows you to configure the advanced options of the Saxon HE / PE / EE engine for the current transformation scenario. To configure the same options globally, go to the Saxon-HE/PE/EE preferences page. For the current transformation scenario, these Advanced options override the options configured in the Saxon-HE/PE/EE preferences page. The Initial mode and template option is only available in the Advanced options. It is a Saxon-specific option that sets the name of the first XSLT template that starts the XSLT transformation or the initial mode of the transformation.
- Parameters Opens the Configure parameters dialog box, allowing you to configure the XSLT parameters used in the current transformation. In this dialog box, you can also configure the parameters of additional stylesheets by using the Additional XSLT stylesheets button. If the XSLT transformation engine is custom-defined, you can not use this dialog box to configure the parameters sent to the custom engine. Instead, you can copy all parameters from the dialog box using contextual menu actions and edit the custom XSLT engine to include the necessary parameters in the command line that starts the transformation process.
- Extensions Opens the dialog box for configuring the XSLT/XQuery extension jars or classes that define extension Java functions or extension XSLT elements used in the transformation.
- Additional XSLT stylesheets Opens the dialog box for adding XSLT stylesheets that are applied on the main stylesheet that is specified in the XSL URL field. This is useful when a chain of XSLT stylesheets must be applied to the input XML document.

The FO Processor Tab

The **FO Processor** tab contains the following options:

- **Perform FO Processing** Specifies whether an FO processor is applied (either the built-in Apache FOP engine or an external engine defined in **Preferences**) during the transformation.
- **XSLT result as input** The FO processor is applied to the result of the XSLT transformation that is defined in the **XSLT** tab.
- XML URL as input The FO processor is applied to the input XML file.
- Method The output format of the FO processing. Available options depend on the selected processor type.

• **Processor** - Specifies the FO processor. It can be the built-in Apache FOP processor or an *external processor*.

The Output Tab

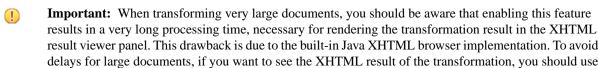

The **Output** tab contains the following options:

- **Prompt for file** At the end of the transformation, a file browser dialog box is displayed for specifying the path and name of the file that stores the transformation result.
- Save As The path of the file where the result of the transformation is stored.
- Open in Browser/System Application If enabled, Oxygen XML Developer plugin automatically opens the result of the transformation in a system application associated with the file type of the result (for example, .pdf files are usually opened in the *Acrobat Reader* application).

Note: To set the web browser that is used for displaying HTML/XHTML pages, *open the Preferences dialog box*, then go to **General** > **Web Browser**.

- Saved file When Open in Browser/System Application is selected, this button can be used to specify
 that Oxygen XML Developer plugin automatically opens the file specified in the Save As text field at
 the end of the transformation.
- Other location When Open in System Application is selected, this option can be used to specify that
 Oxygen XML Developer plugin opens the file specified here.
- Open in editor When this is enabled, the transformation result specified in the Save As field is opened in a new editor panel with the appropriate built-in editor type (for example, if the result is an XML file it is opened in the built-in XML editor, or if it is an XSL-FO file it is opened with the built-in FO editor).
- Show in results view as
 - XHTML Can only be enabled if Open in Browser/System Application is disabled. If this is checked, Oxygen
 XML Developer plugin displays the transformation result in a built-in XHTML browser panel at the bottom of
 the application window.

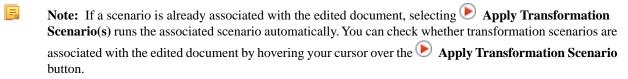

an external browser by checking the **Open in browser** option.

- **XML** If this is checked, Oxygen XML Developer plugin displays the transformation result in an XML viewer panel at the bottom of the application window with *syntax highlighting*, specific for XML documents.
- Image URLs are relative to If Show in results view as XHTML is checked, this text field specifies the path used to resolve image paths contained in the transformation result.

XProc Transformation

A sequence of transformations described by an XProc script can be executed with an XProc transformation scenario. To create an **XProc transformation** scenario, use one of the following methods:

- Go to Window > Show View and select Transformation Scenarios to display this view. Click the New button and select XProc transformation.
- Use the Configure Transformation Scenario(s) (Alt + Shift + T, C (Meta + Alt + T, C on OS X)) action from the Transformation toolbar or the XML menu. Then click the New button and select XProc transformation.
- Use the Apply Transformation Scenario(s) (Alt + Shift + T, T (Meta + Alt + T, T on OS X)) action from the Transformation toolbar or the XML menu. Then click the New button and select XProc transformation.

All three methods open the **New Scenario** dialog box. This dialog box allows you to configure the options that control the transformation.

The lower part of the dialog box contains the following tabs:

- XProc
- Inputs
- Parameters
- Outputs
- Options

The XProc Tab

The **XProc** tab contains the following options:

• **XProc URL** - Specifies the source XSL file that the transformation will use. This URL is resolved through the catalog resolver. If the catalog does not have a mapping for the URL, the file is used directly from its remote location.

You can use the following browsing buttons to enter value in the **XProc URL**:

Insert Editor Variables

Opens a pop-up menu allowing you to introduce special Oxygen XML Developer plugin editor variables or custom editor variables in the XML URL field.

Browse for local file

Opens a local file browser dialog box allowing you to select a local file.

Browse workspace

Opens a file browser dialog box allowing you to select a file from the local workspace.

Browse for remote file

Opens an URL browser dialog box allowing you to select a remote file.

Browse for archived file

Opens a zip archive browser dialog box allowing you to select a file from a zip archive.

Browse Data Source Explorer

Opens the **Data Source Explorer** window.

Search for file

Allows you to find a file in the current project.

• **Processor** - Allows you to select the XProc engine. You can select the built-in *Calabash* engine or a custom engine that is *configured in the Preferences dialog box*.

The Inputs Tab

The **Inputs** tab contains a list with the ports that the XProc script uses to read input data. Use the **Filter** text box to search for a specific term in the entire ports collection.

Each input port has an assigned name in the XProc script. The XProc engine reads data from the URL specified in the URL column. The *built-in editor variables* and *custom editor variables* can be used to specify the URL.

The following actions are available for managing the input ports:

New

Opens an Edit dialog box that allows you to add a new port and its URL.

Edit

Opens an **Edit** dialog box that allows you to modify the selected port and its URL.

Delete

Removes the selected port from the list. It is enabled only for new ports that have been added to the list.

The **Parameters** tab presents a list of ports and parameters collected from the XProc script. The tab is divided into three sections:

- List of Ports In this section you can use the **New** and **Delete** buttons to add or remove ports.
- List of Parameters This section presents a list of parameters for each port and includes columns for the parameter
 name, namespace URI, and its value. Use the Filter text box to search for a specific term in the entire parameters
 collection. You can use the New and Delete buttons to add or remove parameters. You can edit the value of each
 cell in this table by double-clicking the cell. You can also sort the parameters by clicking the column headers.
- Editor Variable Information The built-in editor variables and custom editor variables can be used for specifying the URI. The message pane at the bottom of the dialog box provides more information about the editor variables that can be used.

The Outputs Tab

The **Outputs** tab displays a list of output ports (along with the URL) collected from the XProc script. Use the **Filter** text box to search for a specific term in the entire ports collection. You can also sort the columns by clicking the column headers.

The following actions are available for managing the output ports:

New

Opens an **Edit** dialog box that allows you to add a new output port and its URL. An *editor variable* can be inserted for the URL by using the ... **Insert Editor Variables** button. There is also a **Show in transformation results view** option that allows you to select whether or not the results will be displayed in the output results view.

Edit

Opens an **Edit** dialog box that allows you to edit an existing output port and its URL. An *editor variable* can be inserted for the URL by using the **!... Insert Editor Variables** button. There is also a **Show in transformation results view** option that allows you to select whether or not the results will be displayed in the output results view.

Delete

Removes the selected output port from the list. It is enabled only for new ports that have been added to the list.

Additional options that are available at the bottom of this tab include:

Open in Editor

If this option is selected, the XProc transformation result is automatically opened in an editor panel.

Open in Browser/System Application

If this option is selected, you can specify a file to be opened at the end of the XProc transformation in the browser or system application that is associated with the file type. An *editor variable* can be inserted for the path by using the ... Insert Editor Variables button.

Results

The result of the XProc transformation can be displayed as a sequence in an output view with two sections:

- A list with the output ports on the left side.
- The content that correspond to the selected output port on the right side.

Figure 184: XProc Transformation Results View

The Options Tab

The **Options** tab displays a list of the options collected from the XProc script. The tab is divided into two sections:

- List of Options This section presents a list of options and includes columns for the option name, namespace URI, and its value. Use the Filter text box to search for a specific term in the entire options collection. You can use the New and Delete buttons to add or remove options. You can edit the value of each cell in this table by double-clicking the cell. You can also sort the parameters by clicking the column headers. The names of edited options are displayed in bold.
- Editor Variable Information The built-in editor variables and custom editor variables can be used for specifying the URI. This section provides more information about the editor variables that can be used.

Configuring Calabash with XEP

To generate PDF output from your XProc pipeline (when using the Calabash XProc processor), follow these steps:

- 1. Open the [OXYGEN INSTALLATION DIRECTORY]/lib/xproc/calabash/engine.xml file.
- 2. Uncomment the <system-property name="com.xmlcalabash.fo-processor"
 value="com.xmlcalabash.util.FoXEP"/> system property.
- 3. Uncomment the <system-property name="com.renderx.xep.CONFIG" file="../../tools/xep/xep.xml"/> system property. Edit the file attribute to point to the configuration file that is usually located in the XEP installation folder.
- **4.** Uncomment the references to the XEP libraries. Edit them to point to the matching library names from the XEP installation directory.
- 5. Restart Oxygen XML Developer plugin.

Integration of an External XProc Engine

The Javadoc documentation of the XProc API is available for download from the application website as a zip file <code>xprocAPI.zip</code>. To create an XProc integration project, follow these steps:

- 1. Move the oxygen. jar file from [OXYGEN_DIR]/lib to the lib folder of your project.
- 2. Implement the ro.sync.xml.transformer.xproc.api.XProcTransformerInterface interface.
- 3. Create a Java archive (jar) from the classes you created.
- **4.** Create a engine.xml file according with the engine.dtd file. The attributes of the engine element are as follows:
 - **1.** name The name of the XProc engine.
 - 2. description A short description of the XProc engine.
 - **3.** class The complete name of the class that implements ro.sync.xml.transformer.xproc.api.XProcTransformerInterface.
 - **4.** version The version of the integration.
 - **5.** engineVersion The version of the integrated engine.
 - **6.** vendor The name of the vendor / implementer.

7. supports Validation - true if the engine supports validation, false otherwise.

The engine element has only one child, runtime. The runtime element contains several library elements with the name attribute containing the relative or absolute location of the libraries necessary to run this integration.

- 5. Create a folder with the name of the integration in the [OXYGEN_DIR]/lib/xproc.
- 6. Place the engine.xml and all the libraries necessary to run the new integration in that folder.

XQuery Transformation

To create an **XQuery transformation** scenario, use one of the following methods:

- Go to **Window** > **Show View** and select **Transformation Scenarios** to display this view. Click the **New** button and select **XQuery transformation**.
- Use the Configure Transformation Scenario(s) (Alt + Shift + T, C (Meta + Alt + T, C on OS X)) action from the Transformation toolbar or the XML menu. Then click the New button and select XQuery transformation.
- Use the Apply Transformation Scenario(s) (Alt + Shift + T, T (Meta + Alt + T, T on OS X)) action from the Transformation toolbar or the XML menu. Then click the New button and select XQuery transformation.
 - Note: If a scenario is already associated with the edited document, selecting Apply Transformation Scenario(s) runs the associated scenario automatically. You can check whether transformation scenarios are associated with the edited document by hovering your cursor over the Apply Transformation Scenario button.

All three methods open the **New Scenario** dialog box. This dialog box allows you to configure the options that control the transformation.

The lower part of the dialog box contains the following tabs:

- XQuery
- FO Processor
- Output

The XQuery Tab

The **XQuery** tab contains the following options:

- XML URL Specifies the source XML file. This URL is resolved through the catalog resolver. If the catalog does not have a mapping for the URL, then the file is used directly from its remote location.
 - Note: If the transformer engine is Saxon 9 and a custom URI resolver is configured in **Preferences** for Saxon 9, the XML input of the transformation is passed to that URI resolver.
- **XQuery URL** specifies the source XQuery file that the transformation will use. This URL is resolved through the catalog resolver. If the catalog does not have a mapping for the URL, the file is used directly from its remote location.

You can use the following browsing buttons to enter values in the XML URL and XQuery URL fields:

Insert Editor Variables

Opens a pop-up menu allowing you to introduce special *Oxygen XML Developer plugin editor variables* or *custom editor variables* in the XML URL field.

Browse for local file

Opens a local file browser dialog box allowing you to select a local file.

Browse workspace

Opens a file browser dialog box allowing you to select a file from the local workspace.

Browse for remote file

Opens an URL browser dialog box allowing you to select a remote file.

Opens a zip archive browser dialog box allowing you to select a file from a zip archive.

Browse Data Source Explorer

Opens the **Data Source Explorer** window.

Search for file

Allows you to find a file in the current project.

The rest of the options available in the **XQuery** tab allow you to further customize the transformation scenario:

- Transformer This drop-down menu presents all the transformation engines available to Oxygen XML Developer plugin for performing a transformation. These are the built-in engines and the external engines defined in the Custom Engines preferences page. The engine you choose in this dialog box is used as the default transformation engine. Also, if an XSLT or XQuery document does not have an associated validation scenario, this transformation engine is used in the validation process (if it provides validation support).;
 - Material Section Service Service
- Parameters Opens the Configure parameters dialog box for configuring the XQuery parameters. You can use buttons in this dialog box you can add, edit, or remove parameters. If the XQuery transformation engine is custom-defined you can not use this dialog box to set parameters. Instead, you can copy all parameters from the dialog box using contextual menu actions and edit the custom XQuery engine to include the necessary parameters in the command line that starts the transformation process.
 - Note: Use the Filter text box to search for a specific term in the entire parameters collection.
- Extensions Opens the dialog box for configuring the XSLT/XQuery extension jars or classes that define extension Java functions or extension XSLT elements used in the transformation.

The FO Processor Tab

The **FO Processor** tab contains the following options:

- **Perform FO Processing** Specifies whether an FO processor is applied (either the built-in Apache FOP engine or an external engine defined in **Preferences**) during the transformation.
- **XQuery result as input** the FO processor is applied to the result of the XQuery transformation defined in the **XQuery** tab.
- XML URL as input The FO processor is applied to the input XML file.
- Method The output format of the FO processing. Available options depend on the selected processor type.
- **Processor** Specifies the FO processor. It can be the built-in Apache FOP processor or an *external processor*.

The Output Tab

The **Output** tab contains the following options:

- **Present as a sequence** Enabling this option will reduce the time necessary to fetch the full result, as it will only fetch the first chunk of the result.
- **Prompt for file** At the end of the transformation, a file browser dialog box is displayed for specifying the path and name of the file that stores the transformation result.
- Save As The path of the file where the result of the transformation is stored.
- Open in Browser/System Application If enabled, Oxygen XML Developer plugin automatically opens the result
 of the transformation in a system application associated with the file type of the result (for example, .pdf files are
 usually opened in the Acrobat Reader application).

Note: To set the web browser that is used for displaying HTML/XHTML pages, *open the Preferences dialog box*, then go to **General** > **Web Browser**.

• Saved file - When Open in Browser/System Application is selected, this button can be used to specify that Oxygen XML Developer plugin automatically opens the file specified in the Save As text field at the end of the transformation.

- Other location When Open in System Application is selected, this option can be used to specify that Oxygen XML Developer plugin opens the file specified here.
- Open in editor When this is enabled, the transformation result specified in the Save As field is opened in a new editor panel with the appropriate built-in editor type (for example, if the result is an XML file it is opened in the built-in XML editor, or if it is an XSL-FO file it is opened with the built-in FO editor).
- · Show in results view as
 - XHTML Can only be enabled if Open in Browser/System Application is disabled. If this is checked, Oxygen XML Developer plugin displays the transformation result in a built-in XHTML browser panel at the bottom of the application window.
 - Important: When transforming very large documents, you should be aware that enabling this feature results in a very long processing time, necessary for rendering the transformation result in the XHTML result viewer panel. This drawback is due to the built-in Java XHTML browser implementation. To avoid delays for large documents, if you want to see the XHTML result of the transformation, you should use an external browser by checking the **Open in browser** option.
 - **XML** If this is checked, Oxygen XML Developer plugin displays the transformation result in an XML viewer panel at the bottom of the application window with *syntax highlighting*, specific for XML documents.
- Image URLs are relative to If Show in results view as XHTML is checked, this text field specifies the path used to resolve image paths contained in the transformation result.

SQL Transformation

To create an **SQL transformation** scenario, use one of the following methods:

- Go to Window > Show View and select Transformation Scenarios to display this view. Click the New button and select SQL transformation.
- Use the Configure Transformation Scenario(s) (<u>Alt + Shift + T, C (Meta + Alt + T, C on OS X)</u>) action from the **Transformation** toolbar or the **XML** menu. Then click the **New** button and select **SQL transformation**.
- Use the Apply Transformation Scenario(s) (Alt + Shift + T, T (Meta + Alt + T, T on OS X)) action from the Transformation toolbar or the XML menu. Then click the New button and select SQL transformation.
 - Note: If a scenario is already associated with the edited document, selecting Apply Transformation Scenario(s) runs the associated scenario automatically. You can check whether transformation scenarios are associated with the edited document by hovering your cursor over the Apply Transformation Scenario button.

All three methods open the **New Scenario** dialog box. This dialog box allows you to configure the following options that control the transformation:

- Name The unique name of the SQL transformation scenario.
- **SQL URL** Allows you to specify the URL of the SQL script. You can use the following browsing buttons to enter value in this field:

Insert Editor Variables

Opens a pop-up menu allowing you to introduce special *Oxygen XML Developer plugin editor variables* or *custom editor variables* in the XML URL field.

Browse for local file

Opens a local file browser dialog box allowing you to select a local file.

📴 Browse workspace

Opens a file browser dialog box allowing you to select a file from the local workspace.

Browse for remote file

Opens an URL browser dialog box allowing you to select a remote file.

Browse for archived file

Opens a zip archive browser dialog box allowing you to select a file from a zip archive.

Browse Data Source Explorer

Opens the *Data Source Explorer* window.

Search for file

Allows you to find a file in the current project.

- Connection Allows you to select a connection from a drop-down list. To configure a connection, use the
 Advanced options button to open the data source preferences page.
- **Parameters** Allows you to configure the parameters of the transformation.

Configure Transformation Scenario(s) Dialog Box

You can use the **Configure Transformation Scenarios**(s) dialog box to manage both the *built-in transformation scenarios* and the ones you create.

To open this dialog box, use the Configure Transformation Scenario(s) (<u>Alt + Shift + T, C (Meta + Alt + T, C on OS X)</u>) action from the **Transformation** toolbar or the **XML** menu.

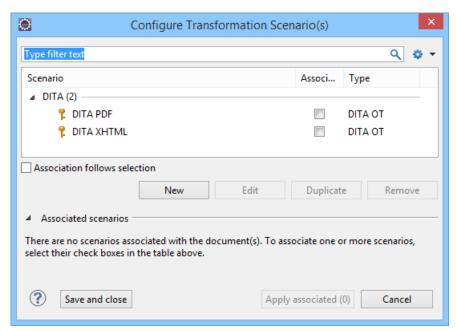

Figure 185: Configure Transformation Scenario(s) Dialog Box

The top section of the dialog box contains a filter that allows you to search through the scenarios list. The Settings button allows you to configure the following options:

- Show all scenarios Select this option to display all the available scenarios, regardless of the document they are associated with.
- Show only the scenarios available for the editor Select this option to only display the scenarios that Oxygen XML Developer plugin can apply for the current document type.
- Show associated scenarios Select this option to only display the scenarios associated with the document you are editing.

- Import scenarios This option opens the Import scenarios dialog box that allows you to select the scenarios file that contains the scenarios you want to import. If one of the scenarios you import is identical to an existing scenario, Oxygen XML Developer plugin ignores it. If a conflict appears (an imported scenario has the same name as an existing one), you can choose between two options:
 - Keep or replace the existing scenario.
 - Keep both scenarios.
 - Note: When you keep both scenarios, Oxygen XML Developer plugin adds imported to the name of the imported scenario.
- Export selected scenarios Use this option to export transformation and validation scenarios individually.

 Oxygen XML Developer plugin creates a scenarios file that contains the scenarios that you export.

The middle section of the dialog box displays the scenarios that you can apply to the current document. You can view both the scenarios associated with the current document type and the scenarios defined at project level. The following columns are used to display the transformation scenarios:

- Association The check-boxes in this column mark whether a transformation scenario is associated with the current document.
- Scenario This column presents the names of the transformation scenarios.
- **Type** Displays the type of the transformation scenario. For further details about the different types of transformation scenarios available in Oxygen XML Developer plugin see the *Defining a New Transformation Scenario* section.
- Storage Displays where a transformation scenario is stored (the Show Storage option must be enabled.)

To sort each column you can left-click its header. The contextual menu of each header allows you to do the following:

- **Show Type** Use this option to display the transformation type of each scenario.
- Show Storage Use this option to display the storage location of the scenarios.
- **Group by Type** Select this option to group the scenarios by their type.
- Group by Storage Select this option to group the scenarios by their storage location.
- **E** Ungroup all Select this option to ungroup all the scenarios.
- **Reset Layout** Select this option to restore the default settings of the layout.

The bottom section of the dialog box contains the following actions:

- **Association follows selection** Enable this check-box to automatically associate selected transformation scenarios with the current document. This option can also be used for multiple selections.
 - **Note:** When this option is enabled, the **Association** column is hidden.
- New This button allows you to create a new transformation scenario, depending upon its type.
- Edit This button opens the Edit Scenario dialog box that allows you to configure the options of the transformations scenario.
 - **Note:** If you try to edit a transformation scenario associated with a defined document type, Oxygen XML Developer plugin displays a warning message to inform you that this is not possible and gives you the option to create a *duplicate transformation scenario* to edit instead.
- **Duplicate** Use this button to create a *duplicate transformation scenario*.
- Remove Use this button to remove transformation scenarios.
 - Note: Removing scenarios associated with a defined document type is not allowed.

The **Edit**, **Duplicate**, **Remove**, **Import scenarios**, and **Export selected scenarios**actions are also available in the contextual menu of the transformation scenarios listed in the middle section of the dialog box.

Duplicating a Transformation Scenario

Use the following procedure to duplicate a transformation scenario. This is useful for creating a scenario that is similar to an existing one.

- 1. Open the Configure Transformation dialog by using the Configure Transformation Scenario(s) (Alt + Shift + T, C (Meta + Alt + T, C on OS X)) action from the Transformation toolbar or the XML menu.
- 2. Create a copy of a scenario by selecting the scenario and clicking the **Duplicate** button.
- 3. Enter a new name in the Name field.
 - a) You can choose to save the scenarios at project level by selecting the **Project Options** setting.
- **4.** Click **OK** to save the scenario.

Editing a Transformation Scenario

Editing a transformation scenario is useful if you need to configure some of its parameters.

Oxygen XML Developer plugin allows you to configure existing transformation scenarios by using one of the following methods:

- Go to **Window** > **Show View** and select *** Transformation Scenarios** to display this view. Then select the scenario and click the *** Edit** button.
- Use the Configure Transformation Scenario(s) (<u>Alt + Shift + T, C (Meta + Alt + T, C on OS X)</u>) action from the Transformation toolbar or the XML menu. Then select the scenario and click the **Edit** button.
- Use the Apply Transformation Scenario(s) (Alt + Shift + T, T (Meta + Alt + T, T on OS X)) action from the Transformation toolbar or the XML menu. Then select the scenario and click the Edit button.

Note: If a scenario is already associated with the edited document, selecting Apply Transformation Scenario(s) runs the associated scenario automatically. You can check whether transformation scenarios are associated with the edited document by hovering your cursor over the Apply Transformation Scenario button.

You can edit transformation scenarios that are defined at project level only. To edit a transformation scenario that is associated with a defined document type, duplicate it and edit the duplicated scenario.

Apply Batch Transformations

A transformation action can be applied on a batch of selected files *from the contextual menu of the Project view* without having to open the files involved in the transformation. You can apply the same scenario to a batch of files or multiple scenarios to a single file or batch of files.

- 1. (Optional, but recommended) Organize the files you want to transform in logical folders.
 - a) Create a logical folder in the **Project** view by using the **New** > **Logical Folder** action from the contextual menu of the root file.
 - b) Add files you want to transform to the logical folder by using the Add Files or Add Edited File actions from the contextual menu of the logical folder.

Note: You can skip this step if the files are already in a dedicated folder that does not include any additional files or folders. You can also manually select the individual files in the **Project** view each time you want to transform them, but this can be tedious.

2. Right-click the newly created logical folder and select **Transform** > Configure **Transformation Scenario(s)** to select one or more transformation scenarios to be applied on all the files in the logical folder.

Note: These types of transformation scenarios must be configured with the current file (\${cf}) or current file URL (\${currentFileURL}) editor variables for the input file. This ensures that each file becomes the current file when its turn arrives in the batch transformation process. Edit the transformation scenario to make sure the appropriate editor variable is assigned for the input file. For example, for a DocBook PDF transformation make sure the **XML URL** input box is set to the \${currentFileURL}} editor variable. For a DITA PDF transformation make sure the args .input parameter is set to the \${cf}} editor variable.

- 3. Now that logical folder has been associated with one or more transformation scenarios, whenever you want to apply the same batch transformation you can select **Transform** > Transform with from the contextual menu and the same previously associated scenario(s) will be applied.
- **4.** If you want a different type of transformation to be applied to each file inside the logical folder, associate individual scenarios for each file and select **Transform** > Apply **Transformation Scenario(s)** from the contextual menu of the logical folder.

Built-in Transformation Scenarios

Oxygen XML Developer plugin included preconfigured built-in transformation scenarios that are used for common transformations. To obtain the desired output, use the Apply Transformation Scenario(s) (Alt + Shift + T, T (Meta + Alt + T, T on OS X)) action from the Transformation toolbar or the XML menu and choose one of the built-in scenarios for the current document.

You can use the Apply Transformation Scenario(s) action even if the current document is not associated with a transformation scenario.

If the document contains an xml-stylesheet processing instruction that refers to an XSLT stylesheet (commonly used to display the document in web browsers), Oxygen XML Developer plugin prompts you to associate the document with a built-in transformation scenario.

The default transformation scenario is suggested based on the processing instruction from the edited document. The **XSL URL** field of the default transformation scenario contains the URL from the href attribute of the processing instruction. By default, the **Use xml-stylesheet declaration** check-box is enabled, Saxon is used as the transformation engine, and no FO processing is performed. The result of the transformation is store in a file with the same URL as the edited document, but the extension is changed to html. The name and path are preserved because the output file name is specified with the help of two *editor variables*: \${cfd} and \${cfn}.

Sharing the Transformation Scenarios

The transformation scenarios and their settings can be shared with other users by *exporting them to a specialized scenarios file* that can then be imported.

Transformation Scenarios View

You can manage the transformation scenarios by using the **Transformation Scenarios** view. To open this view, go to **Window** > **Show View** > **Transformation Scenarios**.

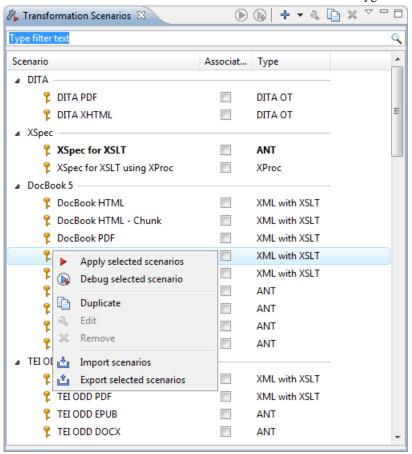

Figure 186: The Scenarios view

The following options are available in the contextual menu of the **Transformation Scenarios** view:

Apply selected scenarios

Select this option to run the current transformation scenario.

Debug selected scenario

Select this option to switch to the **Debugger** perspective and initialize it with the parameters from the scenario (the XML, XSLT, or XQuery input, the transformation engine, the XSLT parameters).

Duplicate

Adds a new scenario to the list that is a duplicate of the current scenario. It is useful for creating a scenario that is similar to an existing one.

Edit

Opens the dialog box for editing the parameters of a transformation scenario.

× Remove

Removes the current scenario from the list. This action is also available by using the **Delete** key.

Import scenarios

This option opens the **Import scenarios** dialog box that allows you to select the scenarios file that contains the scenarios you want to import. If one of the scenarios you import is identical to an existing scenario, Oxygen XML Developer plugin ignores it. If a conflict appears (an imported scenario has the same name as an existing one), you can choose between two options:

- Keep or replace the existing scenario.
- Keep both scenarios.

Note: When you keep both scenarios, Oxygen XML Developer plugin adds imported to the name of the imported scenario.

Export selected scenarios

Use this option to export transformation and validation scenarios individually. Oxygen XML Developer plugin creates a scenarios file that contains the scenarios that you export.

Along with the options available in the contextual menu, the **Transformation Scenarios** view toolbar contains a **New** drop-down button that contains a list of the scenarios you can create. Oxygen XML Developer plugin determines the most appropriate scenarios for the current type of file and displays them at the beginning of the list, followed by the rest of the scenarios.

The Settings drop-down menu allows you to configure the following options:

- Show all scenarios Select this option to display all the available scenarios, regardless of the document they are associated with.
- Show only the scenarios available for the editor Select this option to only display the scenarios that Oxygen XML Developer plugin can apply for the current document type.
- Show associated scenarios Select this option to only display the scenarios associated with the document you are editing.
- Import scenarios This option opens the Import scenarios dialog box that allows you to select the scenarios file that contains the scenarios you want to import. If one of the scenarios you import is identical to an existing scenario, Oxygen XML Developer plugin ignores it. If a conflict appears (an imported scenario has the same name as an existing one), you can choose between two options:
 - Keep or replace the existing scenario.
 - Keep both scenarios.
 - Ħ

Note: When you keep both scenarios, Oxygen XML Developer plugin adds imported to the name of the imported scenario.

- Export selected scenarios Use this option to export transformation and validation scenarios individually. Oxygen XML Developer plugin creates a scenarios file that contains the scenarios that you export.
- **Show Type** Use this option to display the transformation type of each scenario.
- Show Storage Use this option to display the storage location of the scenarios.
- Group by Type Select this option to group the scenarios by their type.
- Group by Storage Select this option to group the scenarios by their storage location.
- **Ungroup all** Select this option to ungroup all the scenarios.
- **Reset Layout** Select this option to restore the default settings of the layout.

Oxygen XML Developer plugin supports multiple scenarios association. To associate multiple scenarios with a document, enable the check-boxes in front of each scenario. You can also associate multiple scenarios with a document from the **Configure Transformation Scenario(s)** or **Configure Validation Scenario(s)** dialog boxes.

The **Transformation Scenarios** presents both global scenarios and project scenarios. By default, Oxygen XML Developer plugin presents the items in the **Transformation Scenarios** in the following order: scenarios matching the current framework, scenarios matching the current project, scenarios matching other frameworks. You can group the scenarios depending on the columns in the **Transformation Scenarios** view. Right click the name of a column to choose how to group the scenarios. The following grouping options are available:

- Group by Type Select this option to group the scenarios by their type.
- Group by Storage Select this option to group the scenarios by their storage location.

Debugging PDF Transformations

To debug a DITA PDF transformation scenario using the XSLT Debugger follow these steps:

- 1. *Open the Preferences dialog box*, go to XML > XML Catalog, click Add, and select the file located at DITA_OT_DIR\plugins\org.dita.pdf2\cfg\catalog.xml.
- 2. Open the map in the DITA Maps Manager and create a DITA Map PDF transformation scenario.
- 3. Edit the scenario, go to the **Parameters** tab and change the value of the **clean.temp** parameter to **no**.
- **4.** Run the transformation scenario.
- **5.** Open the **stage1.xml** file located in the temporary directory and *format and indent* it.
- 6. Create a transformation scenario for this XML file by associating the topic2fo_shell_fop.xsl stylesheet located at DITA_OT_DIR\plugins\org.dita.pdf2\xsl\fo\topic2fo_shell_fop.xsl. If you are specifically using the RenderX XEP or Antenna House FO processors to build the PDF output, you should use the XSL stylesheets topic2fo_shell_xep.xsl or topic2fo_shell_axf.xsl located in the same folder.
- 7. In the transformation scenario edit the XSLT Processor combo box choose the Saxon EE XSLT processor (the same processor used when the DITA OT transformation is executed).
- **8.** In the transformation scenario edit the **Parameters** list and set the parameter *locale* with the value *en_GB* and the parameter *customizationDir.url* to point either to your customization directory or to the default DITA OT customization directory. It's value should have an URL syntax like:file://c:/path/to/DITA_OT_DIR/plugins/org.dita.pdf2/cfg.
- 9. Debug the transformation scenario.

XSLT Processors

This section explains how to configure an XSLT processor and extensions for such a processor in Oxygen XML Developer plugin.

Supported XSLT Processors

Oxygen XML Developer plugin includes the following XSLT processors:

- Xalan 2.7.1 Xalan-Java is an XSLT processor for transforming XML documents into HTML, text, or other XML document types. It implements XSL Transformations (XSLT) Version 1.0 and XML Path Language (XPath) Version 1.0
- Saxon 6.5.5 Saxon 6.5.5 is an XSLT processor that implements the Version 1.0 XSLT and XPath with a number of powerful extensions. This version of Saxon also includes many of the new features that were first defined in the XSLT 1.1 working draft, but for conformance and portability reasons these are not available if the stylesheet header specifies version="1.0".
- Saxon 9.6.0.7 Home Edition (HE), Professional Edition (PE) Saxon-HE/PE implements the basic conformance level for XSLT 2.0 / 3.0 and XQuery 1.0. The term basic XSLT 2.0 / 3.0 processor is defined in the draft XSLT 2.0 / 3.0 specifications. It is a conformance level that requires support for all features of the language other than those that involve schema processing. The HE product remains open source, but removes some of the more advanced features that are present in Saxon-PE.
- Saxon 9.6.0.7 Enterprise Edition (EE) Saxon EE is the schema-aware edition of Saxon and it is one of the built-in processors included in Oxygen XML Developer plugin. Saxon EE includes an XML Schema processor, and schema-aware XSLT, XQuery, and XPath processors.

The validation in schema aware transformations is done according to the W3C XML Schema 1.0 or 1.1. This can be *configured in Preferences*.

- **Note:** Saxon can use the *ICU-J localization library* (saxon9-icu.jar) to add support for sorting and date/number formatting in a wide variety of languages. This library is not included in the Oxygen XML Developer plugin installation kit. However, Saxon will use the default collation and localization support available in the currently used JRE. To enable this capability follow these steps:
 - **1.** Download Saxon 9.6.0.7 Professional Edition (PE) or Enterprise Edition (EE) from http://www.saxonica.com.

- 2. Unpack the downloaded archive.
- **3.** Create a new XSLT transformation scenario (or edit an existing one). In the **XSLT** tab, click the **Extensions** button to open the list of additional libraries used by the transformation process.
- **4.** Click **Add** and browse to the folder where you unpacked the downloaded archive and choose the saxon9-icu.jar file.

Note that the saxon9-icu.jar should NOT be added to the application library folder because it will conflict with another version of the ICU-J library that comes bundled with Oxygen XML Developer plugin.

- Saxon-CE (Client Edition) is Saxonica's implementation of XSLT 2.0 for use on web browsers. Oxygen XML Developer plugin provides support for editing stylesheets that contain Saxon-CE extension functions and instructions. This support improves the validation, content completion, and syntax highlighting.
 - Note: Saxon-CE, being JavaScript-based, was designed to run inside a web browser. This means that you will use Oxygen XML Developer plugin only for developing the Saxon-CE stylesheet, leaving the execution part to a web browser. See more details about *executing such a stylesheet on Saxonica's website*.
 - Note: A specific template, named Saxon-CE stylesheet, is available in the New From Templates wizard.
- **Xsltproc** (libxslt) *Libxslt* is the XSLT C library developed for the Gnome project. Libxslt is based on *libxml2*, the XML C library developed for the Gnome project. It also implements most of the EXSLT set of processor-portable extensions, functions, and some of Saxon's evaluate and expression extensions. The *libxml2* version included in Oxygen XML Developer plugin is 2.7.6 and the Libxslt version is 1.1.26.

Oxygen XML Developer plugin uses Libxslt through its command line tool (Xsltproc). The XSLT processor is included in the distribution kit of the stand-alone version for Windows and Mac OS X. Since there are differences between various Linux distributions, on Linux you must install Libxslt on your machine as a separate application and set the PATH variable to contain the Xsltproc executable.

If you do not have the Libxslt library already installed, you should copy the following files from Oxygen XML Developer plugin stand-alone installation directory to the root of the com.oxygenxml.editor_17.1 plugin:

- on Windows: xsltproc.exe, zlib1.dll,libxslt.dll,libxml2.dll,libexslt.dll,iconv.dll
- on Linux: xsltproc,libexslt.so.0, libxslt.so.1,libxsml2.so.2
- on Mac OS X: xsltproc.mac, libexslt, libxslt, libxml
- Note: The Xsltproc processor can be configured from the *XSLTPROC options page*.
- Caution: Known problem: file paths containing spaces are not handled correctly in the LIBXML processor. For example, the built-in XML catalog files of the predefined document types (DocBook, TEI, DITA, etc) are not handled properly by LIBXML if Oxygen XML Developer plugin is installed in the default location on Windows (C:\Program Files). This is because the built-in XML catalog files are stored in the [OXYGEN_DIR]/frameworks subdirectory of the installation directory, which in this case contains at least a space character.
- MSXML 4.0 MSXML 4.0 is available only on Windows platforms. It can be used for *transformation* and *validation* of XSLT stylesheets.
 - Oxygen XML Developer plugin uses the Microsoft XML parser through its command line tool msxs1.exe.
 - Since msxsl.exe is only a wrapper, Microsoft Core XML Services (MSXML) must be installed on the computer. Otherwise, you will get a corresponding warning. You can get the latest Microsoft XML parser from *Microsoft web-site*.
- **MSXML** .**NET** *MSXML* .*NET* is available only on Windows platforms. It can be used for *transformation* and *validation of XSLT stylesheets*.

Oxygen XML Developer plugin performs XSLT transformations and validations using .NET Framework's XSLT implementation (System.Xml.Xsl.XslTransform class) through the **nxslt** command line utility. The **nxslt** version included in Oxygen XML Developer plugin is 1.6.

You should have the .NET Framework version 1.0 already installed on your system. Otherwise, you will get the following warning: MSXML.NET requires .NET Framework version 1.0 to be installed. Exit code: 128.

You can get the .NET Framework version 1.0 from the *Microsoft website*.

• .NET 1.0 - A transformer based on the System. Xml 1.0 library available in the .NET 1.0 and .NET 1.1 frameworks from Microsoft (http://msdn.microsoft.com/xml/). It is available only on Windows.

You should have the .NET Framework version 1.0 or 1.1 already installed on your system. Otherwise, you will get the following warning: MSXML.NET requires .NET Framework version 1.0 to be installed. Exit code: 128.

You can get the .NET Framework version 1.0 from the *Microsoft website*.

• .NET 2.0 - A transformer based on the System. Xml 2.0 library available in the .NET 2.0 framework from *Microsoft*. It is available only on Windows.

You should have the .NET Framework version 2.0 already installed on your system. Otherwise, you will get the following warning: MSXML.NET requires .NET Framework version 2.0 to be installed. Exit code: 128.

You can get the .NET Framework version 2.0 from the *Microsoft website*.

Configuring Custom XSLT Processors

You can configure and run XSLT and XQuery transformations with processors other than *the ones which come with the Oxygen XML Developer plugin distribution*.

Note:

The output messages of a custom processor are displayed in an output view at the bottom of the application window. If an output message follows *the format of an Oxygen XML Developer plugin linked message*, clicking it highlights the location of the message in an editor panel containing the file referenced in the message.

Configuring the XSLT Processor Extensions Paths

The Xalan and Saxon processors support the use of extension elements and extension functions. Unlike a literal result element, which the stylesheet simply transfers to the result tree, an extension element performs an action. The extension is usually used because the XSLT stylesheet fails in providing adequate functions for accomplishing a more complex task.

For more information about how to use extensions, see the following links:

- Xalan http://xml.apache.org/xalan-j/extensions.html
- Saxon 6.5.5 http://saxon.sourceforge.net/saxon6.5.5/extensions.html
- Saxon 9.6.0.7 http://www.saxonica.com/documentation9.5/index.html#!extensibility

To set an XSLT processor extension (a directory or a jar file), use *the Extensions button* in the **Edit scenario** dialog box.

Note: The old way of setting an extension (using the parameter -Dcom.oxygenxml.additional.classpath) was deprecated, and instead you should use the extension mechanism of the XSLT transformation scenario.

XSL-FO Processors

This section explains how to apply XSL-FO processors when transforming XML documents to various output formats in Oxygen XML Developer plugin.

The Built-in XSL-FO Processor

The Oxygen XML Developer plugin installation package is distributed with the *Apache FOP* that is a Formatting Objects processor for rendering your XML documents to PDF. *FOP* is a print and output independent formatter driven by XSL

Formatting Objects. *FOP* is implemented as a Java application that reads a formatting object tree and renders the resulting pages to a specified output.

Other FO processors can be configured in the **Preferences** dialog box.

Add a Font to the Built-in FO Processor - The Simple Version

If the font that must be set to Apache FOP is one of the fonts that are installed in the operating system you should follow the next steps for creating and setting a FOP configuration file that looks for the font that it needs in the system fonts. It is a simplified version of *the procedure for setting a custom font in Apache FOP*.

- 1. Register the font in FOP configuration. (This is not necessary for DITA PDF transformations, skip to the next step)
 - a) Create a FOP configuration file that specifies that FOP should look for fonts in the installed fonts of the operating system.

- b) *Open the Preferences dialog box*, go to XML > XSLT/FO/XQuery > FO Processors, and enter the path of the FOP configuration file in the Configuration file text field.
- **2.** Set the font on the document content.

This is done usually with XSLT stylesheet parameters and depends on the document type processed by the stylesheet.

- For DocBook documents you can start with the predefined scenario called DocBook PDF, edit the XSLT parameters
 and set the font name (in our example the font family name is Arial Unicode MS) to the parameters
 body.font.family and title.font.family.
- For TEI documents you can start with the predefined scenario called **TEI PDF**, *edit the XSLT parameters* and set the font name (in our example **Arial Unicode MS**) to the parameters bodyFont and sansFont.
- For DITA transformations to PDF using DITA-OT you should modify the following two files:
 - DITA_OT_DIR/plugins/org.dita.pdf2/cfg/fo/font-mappings.xml the font-face element included in each element physical-font having the attribute char-set="default" must contain the name of the font (Arial Unicode MS in our example)
 - DITA_OT_DIR/plugins/org.dita.pdf2/fop/conf/fop.xconf an element auto-detect
 must be inserted in the element fonts which is inside the element renderer having the attribute
 mime="application/pdf":

Add a Font to the Built-in FO Processor

If an XML document is transformed to PDF using the built-in Apache FOP processor but it contains some Unicode characters that cannot be rendered by the default PDF fonts, then a special font that is capable to render these characters must be configured and embedded in the PDF result.

1. Locate the font.

First, find out the name of a font that has the glyphs for the special characters you used. One font that covers most characters, including Japanese, Cyrillic, and Greek, is Arial Unicode MS.

On Windows the fonts are located into the C:\Windows\Fonts directory. On Mac, they are placed in /Library/Fonts. To install a new font on your system, is enough to copy it in the Fonts directory.

- 2. Generate a font metrics file from the font file.
 - a) Open a terminal.
 - b) Change the working directory to the Oxygen XML Developer plugin install directory.
 - c) Create the following script file in the Oxygen XML Developer plugin installation directory.

For OS X and Linux create a file ttfConvert.sh:

```
#!/bin/sh
export LIB=lib
export CP=$LIB/fop.jar
export CP=$CP:$LIB/avalon-framework-4.2.0.jar
export CP=$CP:$LIB/xercesImpl.jar
export CP=$CP:$LIB/commons-logging-1.1.1.jar
export CP=$CP:$LIB/commons-io-1.3.1.jar
export CP=$CP:$LIB/xmlgraphics-commons-1.5.jar
export CP=$CP:$LIB/xmlgraphics-commons-1.5.jar
export CP=$CP:$LIB/xml-apis.jar
export CMD="java -cp $CP org.apache.fop.fonts.apps.TTFReader"
export CMD="java -cp $CP org.apache.fop.fonts.apps.TTFReader"
export FONT_DIR='.'
```

For Windows create a file ttfConvert.bat:

```
@echo off
set LIB=lib
set CP=%LIB%\fop.jar
set CP=%CP%;%LIB%\avalon-framework-4.2.0.jar
set CP=%CP%;%LIB%\xercesImpl.jar
set CP=%CP%;%LIB%\commons-logging-1.1.1.jar
set CP=%CP%;%LIB%\commons-io-1.3.1.jar
set CP=%CP%;%LIB%\xmlgraphics-commons-1.5.jar
set CP=%CP%;%LIB%\xml-apis.jar
set CP=%CP%;%LIB%\xml-apis.jar
set CMD=java -cp "%CP%" org.apache.fop.fonts.apps.TTFReader
set FONT_DIR=C:\Windows\Fonts
%CMD% %FONT_DIR%\Arialuni.ttf Arialuni.xml
```

The paths specified in the file are relative to the Oxygen XML Developer plugin installation directory. If you decide to create it in other directory, change the file paths accordingly.

The *FONT_DIR* can be different on your system. Check that it points to the correct font directory. If the Java executable is not in the *PATH*, specify the full path of the executable.

If the font has bold and italic variants, convert them too by adding two more lines to the script file:

for OS X and Linux:

```
$CMD $FONT_DIR/Arialuni-Bold.ttf Arialuni-Bold.xml
$CMD $FONT_DIR/Arialuni-Italic.ttf Arialuni-Italic.xml
```

for Windows:

```
%CMD% %FONT_DIR%\Arialuni-Bold.ttf Arialuni-Bold.xml
%CMD% %FONT_DIR%\Arialuni-Italic.ttf Arialuni-Italic.xml
```

d) Run the script.

On Linux and OS X, run the command sh ttfConvert.sh from the command line. On Windows, run the command ttfConvert.bat from the command line or double-click the file ttfConvert.bat.

- 3. Register the font in FOP configuration. (This is not necessary for DITA PDF transformations, skip to the next step)
 - a) Create a FOP configuration file that specifies the font metrics file for your font.

```
<font-base>file:/C:/path/to/FOP/font/metrics/files/</font-base>
  <source-resolution>72</source-resolution>
  <target-resolution>72</target-resolution>
  <default-page-settings height="11in" width="8.26in"/>
  <renderers>
    <renderer mime="application/pdf">
      <filterList>
        <value>flate</value>
      </filterList>
      <fonts>
          <font metrics-url="Arialuni.xml" kerning="yes"</pre>
                 embed-url="file:/Library/Fonts/Arialuni.ttf">
              <font-triplet name="Arialuni" style="normal"</pre>
                    weight="normal"/>
          </font>
      </fonts>
    </renderer>
  </renderers>
</fop>
```

The embed-url attribute points to the font file to be embedded. Specify it using the URL convention. The metrics-url attribute points to the font metrics file with a path relative to the base element. The triplet refers to the unique combination of name, weight, and style (italic) for each variation of the font. In our case is just one triplet, but if the font had variants, you would have to specify one for each variant. Here is an example for Arial Unicode if it had italic and bold variants:

```
<fop version="1.0">
    <fonts>
         <font metrics-url="Arialuni.xml" kerning="yes"</pre>
             embed-url="file:/Library/Fonts/Arialuni.ttf">
<font-triplet name="Arialuni" style="normal"</pre>
                    weight="normal"/>
         </font>
         <font metrics-url="Arialuni-Bold.xml" kerning="yes"</pre>
                embed-url="file:/Library/Fonts/Arialuni-Bold.ttf">
             <font-triplet name="Arialuni" style="normal"
                    weight="bold"/>
        </font>
         <font metrics-url="Arialuni-Italic.xml" kerning="yes"</pre>
                embed-url="file:/Library/Fonts/Arialuni-Italic.ttf">
             <font-triplet name="Arialuni" style="italic"
                    weight="normal"/>
         </font>
    </fonts>
</fop>
```

More details about the FOP configuration file are available on the FOP website.

- b) *Open the Preferences dialog box*, go to XML > XSLT/FO/XQuery > FO Processors, and enter the path of the FOP configuration file in the Configuration file text field.
- 4. Set the font on the document content.

This is usually done with XSLT stylesheet parameters and depends on the document type processed by the stylesheet.

For DocBook documents, you can start with the predefined scenario called **DocBook PDF**, *edit the XSLT parameters*, and set the font name (in our example **Arialuni**) to the parameters body, font. family and title, font. family.

For TEI documents, you can start with the predefined scenario called **TEI PDF**, *edit the XSLT parameters*, and set the font name (in our example **Arialuni**) to the parameters bodyFont and sansFont.

For DITA to PDF transformations using DITA-OT modify the following two files:

- DITA_OT_DIR/plugins/org.dita.pdf2/cfg/fo/font-mappings.xml-the font-face element included in each element physical-font having the attribute char-set="default" must contain the name of the font (*Arialuni* in our example)
- DITA_OT_DIR/plugins/org.dita.pdf2/fop/conf/fop.xconf-an element font must be inserted
 in the element fonts which is inside the element renderer having the attribute
 mime="application/pdf":

Adding Libraries to the Built-in FO Processor (XML with XSLT and FO)

Adding Hyphenation Support for XML with XSLT Transformation Scenarios

You can extend the functionality of the built-in FO processor by dropping additional libraries in the [OXYGEN_DIR]/lib/fop directory. To add support for hyphenation:

- **1.** Download the pre-compiled JAR from *OFFO*.
- 2. Copy the fop-hyph. jar file into the [OXYGEN_DIR]/lib/fop folder.
- 3. Restart Oxygen XML Developer plugin.

Adding Support for PDF Images

- 1. Download the fop-pdf-images JAR libraries.
- 2. Copy the libraries into the [OXYGEN_DIR]/lib folder.
- 3. Restart Oxygen XML Developer plugin.

Adding Libraries to the Built-in FO Processor (DITA-OT)

To use additional libraries with the DITA-OT publishing engine, you need to edit the transformation scenario and add the path to the new libraries in the **Libraries** section of the **Advanced** tab.

Adding Hyphenation Support for DITA-OT Transformation Scenarios

- **1.** Download the pre-compiled JAR from *OFFO*.
- 2. Edit the DITA-OT transformation scenario and switch to the **Advanced** tab. Click the **Libraries** button and add the path to the fop-hyph.jar library.

Adding Support for PDF Images

- 1. Download the fop-pdf-images JAR libraries.
- **2.** Edit the DITA-OT transformation scenario and switch to the **Advanced** tab. Click the **Libraries** button and add the path to the libraries.

Output Formats

Oxygen XML Developer plugin allows you to use transformation scenarios to publish XML content in various output formats (such as WebHelp, PDF, CHM, EPUB, JavaHelp, Eclipse Help, XHTML, etc.)

For transformations that are not included in your installed version of Oxygen XML Developer plugin, simply install the tool chain required to perform the specific transformation and process the files in accordance with the processor instructions. A multitude of target formats are possible. The basic condition for transformation to any format is that your source document is well-formed.

Note: You need to use the appropriate stylesheet according to the source definition and the desired output. For example, if you want to transform into an HTML format using a DocBook stylesheet, your source XML document should conform with the DocBook DTD.

For more information, see the *Transformation Scenarios* on page 346 section.

WebHelp System Output

Oxygen XML Developer plugin allows you to obtain WebHelp output from DocBook and DITA documents. This section contains information about the WebHelp system, its variants, and ways to customize it to better fit your specific needs.

WebHelp System Description

WebHelp is a form of online help that consists of a series of web pages (XHTML format). Its advantages include platform independence and continuous content update, since it can be viewed using a regular web browser.

Layout

The layout of the WebHelp system is comprised of two parts:

- The left section that contains separate tabs for **Content**, **Search**, and **Index**.
 - Note: If your documents contain no indexterm elements, the **Index** tab is not generated.
 - Note: You can enhance the appearance of the selected item in the Table of Contents. See the *Customizing WebHelp chapter* for more details.
- The right section where help pages are displayed.

You can navigate through the content of your output using the arrows in the upper-right part of the page. These arrows allow you to move to the parent, previous, and next topic. The parents of the currently opened topic are also presented at the top of the page.

Note: You can edit the args.hide.parent.link parameter to hide the Parent, Next, and Previous links.

You can use the Collapse all button that is displayed in the Content tab to collapse all the topics presented in the Table of Contents.

The top-right corner of the page contains the following options:

- With Frames Displays the output using HTML frames to render two separate sections (a section that displays the Table of Contents in the left side and a section that displays the content of a topic in the right side).
- Print this page Opens a dialog box with various printing options and a print preview.

Figure 187: WebHelp Output

Search Feature

The **Search** feature is enhanced with a rating mechanism that computes scores for every page that matches the search criteria. These scores are then translated into a 5-star rating scheme. The search results are sorted depending on the following:

- The number of keywords found in a single page (the higher the number, the better).
- The context (for example, a word found in a title scores better than a word found in unformatted text). The search ranking order, sorted by relevance is as follows:
 - The search phrase is included in a meta keyword
 - The search phrase is in the title of the page
 - The search phrase is in bold text in a paragraph
 - The search phrase is in normal text in a paragraph

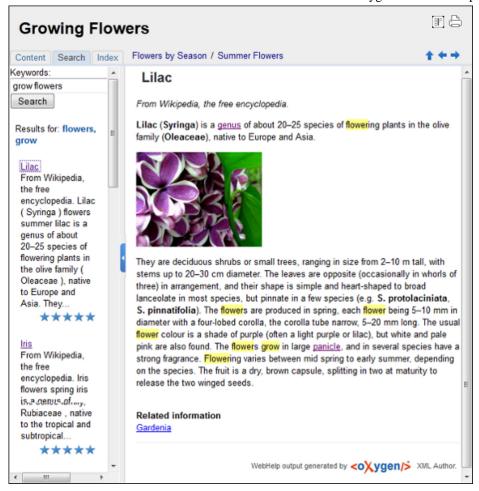

Figure 188: WebHelp Search with Stemming Enabled

Rules that are applied during a search include:

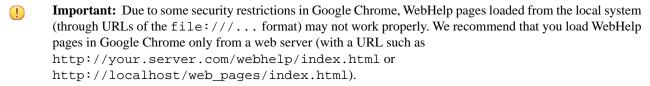

- Boolean searches are supported using the following operators: and, or, not. When there are two adjacent search terms without an operator, or is used as the default search operator (for example, grow flowers is the same as grow or flowers).
- The space character separates keywords (an expression such as grow flowers counts as two separate keywords: grow and flowers).
- Do not use quotes to perform an exact search for multiple word expressions (an expression such as "grow flowers", returns no results since it searches for two separate words).
- indexterm and keywords DITA elements are an effective way to increase the ranking of a page (for example, content inside keywords elements weighs twice as much as content inside an H1 HTML element).
- Words composed by merging two or more words with colon (":"), minus ("-"), underline ("_"), or dot (".") characters count as a single word.
- Always search for words containing three or more characters (shorter words, such as to or of are ignored). This rule does not apply to CJK (Chinese, Japanese, Korean) languages.

HTML tag elements are also assigned a scoring value and these values are evaluated for the search results. For information about editing these values, see the Editing Scoring Values of Tag Elements in Search Results on page 409 topic.

This output format is compatible with most of the most recent versions of the following common browsers:

- Internet Explorer (IE 8 or newer)
- Chrome
- Firefox

- Safari
- Opera

Warning: Due to some restrictions in web browsers in regards to JavaScript code, the *frameless* version (index.html start page) of the WebHelp system should only be loaded from a web server (with a URL such as http://your.server.com/webhelp/index.html or http://localhost/web_pages/index.html). When loading WebHelp pages from the local file system, the *frameset* version (index_frames.html start page) of the WebHelp system should be used instead (file:///...).

WebHelp with Feedback System Description

WebHelp with Feedback is a form of online help system that consists of a series of web pages (XHTML format). Its advantages include platform independence, continuous content update, and a feedback mechanism that allows your authors and audience to interact with one another through comments.

Layout

The layout of the feedback-enabled WebHelp system is similar to the layout of the basic WebHelp and the left section is identical. However, the bottom of the right section contains a **comments** bar. You can click on the **Log in** button on the right side of this bar to be authenticated as a user for the WebHelp system and your user name will be included in any comments that you add. If you do not have a user name, you can click on the **Sign Up** button to create a new user. Under the **comments** bar, you can click the **Add New Comment** button to add a comment, regardless of whether or not you are logged in.

Note: You can enhance the appearance of the selected item in the Table of Contents. See the *Customizing WebHelp chapter* for more details.

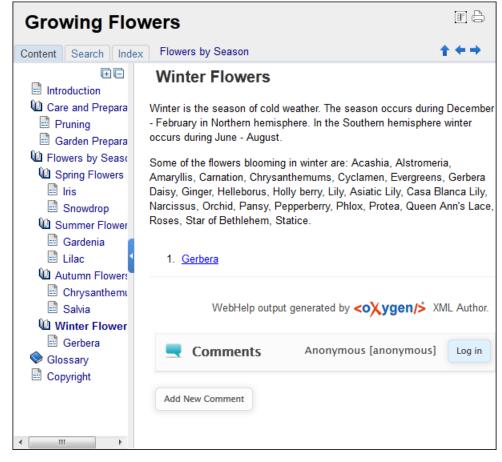

Figure 189: The Layout of the Feedback-Enabled WebHelp System

After you log in, your name and user name are displayed in the Comments bar together with the Log off and Edit buttons. Click the Edit button to open the User Profile dialog box. In this dialog box, you can customize the following options:

- Your Name You can use this field to edit the initial name that you used to create your user profile.
- Your email address You can use this field to edit the initial email address that you used to create your profile.
- You can choose to receive an email in the following situations:
 - When a comment is left on a page that you commented on.
 - When a comment is left on any topic in the WebHelp system.
 - When a reply is left to one of my comments.
- **New Password** Allows you to enter a new password for your user account.
 - Note: The Current Password field from the top of the User Profile is mandatory if you want to save the changes you make.

Search Feature

The Search feature is enhanced with a rating mechanism that computes scores for every page that matches the search criteria. These scores are then translated into a 5-star rating scheme. The search results are sorted depending on the following:

- The number of keywords found in a single page (the higher the number, the better).

- The search phrase is included in a meta keyword
- The search phrase is in the title of the page
- The search phrase is in bold text in a paragraph
- The search phrase is in normal text in a paragraph

Rules that are applied during a search include:

- Boolean searches are supported using the following operators: *and*, *or*, *not*. When there are two adjacent search terms without an operator, *or* is used as the default search operator (for example, *grow flowers* is the same as *grow or flowers*).
- The space character separates keywords (an expression such as *grow flowers* counts as two separate keywords: *grow* and *flowers*).
- Do not use quotes to perform an exact search for multiple word expressions (an expression such as "grow flowers", returns no results since it searches for two separate words).

Deployment of the WebHelp With Feedback System

System Requirements

The feedback-enabled WebHelp system of Oxygen XML Developer plugin requires a standard server deployment. You can request this from your server admin and it needs the following system components:

- A Web server (such as *Apache Web Server*)
- A MySQL or MariaDB database server
- A database admin tool (such as phpMyAdmin)
- PHP Version 5.1.6 or later

Oxygen XML WebHelp system supports most of the recent versions of the following browsers: Chrome, Firefox, Internet Explorer, Safari, Opera.

Create WebHelp with Feedback Database

The WebHelp system needs a database to store user details and the actual feedback, and a user added to it with all privileges. After this is created, you should have the following information:

- Database name
- Username
- Password

Exactly how you create the database and user depends on your web host and your particular needs.

For example, the following procedure uses *phpMyAdmin* to create a MySQL database for the feedback system and a MySQL user with privileges for that database. The feedback system uses these credentials to connect to the database.

Using *phpMyAdmin* to create a database:

- **1.** Type *localhost* in your browser.
- **2.** In the left area, select: *phpMyAdmin*.
- **3.** Click *Databases* (in the right frame) and then create a *database*. You can give it any name you want (for example *comments*).
- **4.** Create a user with connection privileges for this database.
- **5.** Under *localhost*, in the right frame, click *Privileges* and then at the bottom of the page click the **reload the privileges** link.

Deploying the WebHelp output

If you have a web server configured with PHP and MySQL, you can deploy the WebHelp output by following these steps:

- 1. Connect to your server using an FTP client.
- **2.** Locate the home directory (from now on, referred to as *DOCUMENT_ROOT*) of your server.
- **3.** Copy the transformation output folder into the DOCUMENT_ROOT folder.
- 4. Rename it to something relevant, for example, myProductWebHelp.

- **5.** Open the output folder (for example, http://[YOUR_SERVER]/myProductWebHelp/). You are redirected to the WebHelp installation wizard. Proceed with the installation as follows:
 - **a.** Verify that the prerequisites are met.
 - b. Press Start Installation.
 - c. Configure the **Deployment Settings** section. Default values are provided, but you should adjust them as needed.
 - Tip: You can change some of the options later. The installation creates a config.php file in [OXYGEN_WEBHELP]/resources/php/config/config.php where all your configuration options are stored.
 - **d.** Configure the **MySql Database Connection Settings** section. Use the information (database name, username, password) from the *Create WebHelp with Feedback Database section* to fill-in the appropriate text boxes.
 - Warning: Checking the Create new database structure option will overwrite any existing data in the selected database, if it already exists. Therefore, it is useful the first time you install the WebHelp with Feedback system, but you do not want to select this option on subsequent deployments.
 - e. If you are using a domain (such as *OpenLDAP* or *Active Directory*) to manage users in your organization, check the **Enable LDAP Autehntication** option. This will allow you to configure the LDAP server, which will provide information and credentials for users who will access the WebHelp system. Also, this will allow you to choose which of the domain users will have administrator privileges.
 - **f.** If the **Create new database structure** option is checked, the **Create WebHelp Administrator Account** section becomes available. Here you can set the administrator account data. The administrator is able to moderate new posts and manage WebHelp users.

The same database can be used to store comments for different WebHelp deployments. If a topic is available in more than one WebHelp deployments and there are comments associated with it, you can choose to display the comments in all deployments that share the database. To do this, enable the **Display comments from other products** option. In the **Display comments from** section, a list with the deployments sharing the same database is displayed. Select the deployments allowed to share common feedback.

Note: You can restrict the displayed comments of a product depending on its version. If you have two products that use the same database and you restrict one of them to display comments starting from a certain version, the comments of the other product are also displayed from the specified version onwards.

- g. Press Next Step.
- **h.** Remove the installation folder from your web server.
 - Important: When you publish subsequent iterations of your WebHelp system, you will not upload the /install folder in the output, as you only need it uploaded the first time you create the installation. On subsequent uploads, you will just upload the other output files.
- i. In your Web browser, go to your WebHelp system main page.

Testing Your WebHelp with Feedback System

To test your system, create a user and post a comment. Check to see if the notification emails are delivered to your email inbox.

Note: To read debug messages generated by the system:

- 1. Enable JavaScript logging by doing one of the following:
 - Open the log.js file, locate the var log= new Log(Level.NONE); line, and change the logging level to: Level.INFO, Level.DEBUG, Level.WARN, or Level.ERROR.
 - Append ?log=true to the WebHelp URL.
- 2. Inspect the PHP and Apache server log files.

Documentation Product ID and Version

When you run a WebHelp with Feedback transformation scenario, by default you are prompted for a documentation product ID and version number. This is needed when multiple WebHelp systems are deployed on the same server. Think of your WebHelp output as a product. If you have 3 different WebHelp outputs, you have 3 different products (each with their own unique documentation product ID). This identifier is included in a configuration file so that comments are tied to a particular output (product ID and version number).

Note: The WebHelp with Feedback installation includes a configuration option **Display comments from other products** that allows you to choose to have comments be visible in other specified *products*.

Refreshing the Content of a WebHelp with Feedback Installation

It is common to update the content of an existing installation of a WebHelp with Feedback system on a regular basis. In this case, reinstalling the whole system is not a viable option since it might result in the loss of the comments associated with your topics. Also, reconfiguring the system every time you want to refresh it may be time consuming.

However, you can refresh just the content without losing the comments or the initial system configuration, by following these steps:

- 1. Execute the transformation scenario that produces the WebHelp with Feedback output directory.
- 2. Locate the oxygen-webhelp\resources\php\config\config.php file and delete it.
- **3.** Locate the oxygen-webhelp\install directory and delete it.
- 4. Copy the remaining structure of the output folder and paste it into your WebHelp with Feedback system installation directory, overwriting the existing content.

Managing Users and Comments in a WebHelp with Feedback System

When you installed the WebHelp with Feedback system the first time (assuming the *Create new database structure* option was enabled), you should have been prompted to create an administrator account (or a user named administrator was created by default). As an administrator, you have access to manage comments posted in your feedback-enabled WebHelp system. You can also manage the user information (such as role, status, or notification options).

To manage comments and user information, follow these steps:

- 1. At the bottom of each specific topic there is a **Comments** navigation bar and on the right side there is a **Log in** button. Click this button and log in with your administrator credentials. This gives you access to an Admin Panel button.
- 2. Click the Admin Panel button to display an administration panel inside the topic.

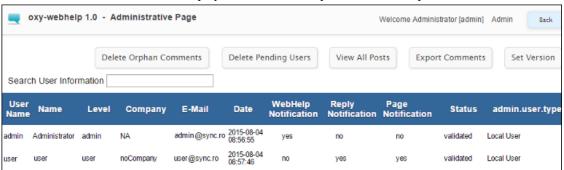

Figure 191: The Administrative Page

3. Use this panel to manage the following options:

Delete Orphaned Comments

Allows you to delete comments that are no longer associated with a topic in your WebHelp system.

Delete Pending Users

Allows you to delete user accounts that you do not wish to activate.

View All Posts

Allows you to view all the comments that are associated with topics in your WebHelp system.

Export Comments

Allows you to export all posts associated with topics in your WebHelp system into an XML file.

Set Version

Use this action to display comments starting with a particular version.

Manage User Information

To edit the details for a user, click on the corresponding row. This opens a window that allows you to customize the following information associated with the user:

Name

The full name of the user.

Level

Use this field to modify the privilege level (role) for the selected user. You can choose from the following:

- User Regular user, able to post comments and receive e-mail notifications.
- **Moderator** In addition to the regular **User** rights, this type of user has access to the **Admin Panel** where a moderator can view, delete, export comments, and set the version of the feedback-enabled WebHelp system.
- Admin Full administrative privileges. Can manage WebHelp-specific settings, users, and their comments.

Company

The name of the organization associated with the user.

E-Mail

The contact email address for the user. This is also the address where the WebHelp system sends notifications.

WebHelp Notification

When enabled, the user receives notifications when comments are posted anywhere in your feedback-enabled WebHelp system.

Reply Notification

When enabled, the user receives notifications when comments are posted as a reply to one of their comments.

Page Notification

When enabled, the user receives notifications when comments are posted on a topic where they previously posted a comment.

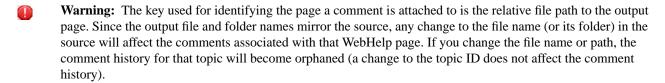

Date

The date the user registered is displayed.

Status

Use this drop-down list to change the status of the user. You can choose from the following:

- Created The user is created but does not yet have any rights for the feedback-enabled WebHelp system.
- Validated The user is able to use the feedback-enabled WebHelp system.
- **Suspended** The user has no rights for the feedback-enabled WebHelp system.

WebHelp Mobile System Description

To further improve its ability to create online documentation, Oxygen XML Developer plugin offers support to transform DocBook And DITA documents into *Mobile WebHelp* systems. This feature generates an output that works on multiple platforms (Android, iOS, BlackBerry, Windows Mobile) and is specially designed for mobile devices. All the specific

touch screen gestures are supported. The functionality of the desktop WebHelp layout is preserved, is organized in an intuitive layout, and offers table of contents, search capabilities, and index navigation.

Figure 192: Mobile WebHelp

Context-Sensitive WebHelp System

Context-sensitive help systems assist users by providing specific informational topics for certain components of a user interface, such as a button or window. This mechanism works based on mappings between a unique ID defined in the topic and a corresponding HTML page.

When WebHelp output is generated by Oxygen XML Developer plugin, the transformation process produces an XML mapping file called context-help-map.xml and copies it in the output folder of the transformation. This XML file maps an ID to a corresponding HTML page, as in the following example:

- helpID Unique ID provided by a topic from two possible sources:
 - The resourceid element set to it in the prolog section:

Note: If you need different parts of the application (for instance, dialog boxes, views, or editing modes) to open the same contextual help topic, all of the context ID values should be included in the same DITA topic file. For example, if you need both a dialog box and a view to open the same WebHelp page, you can assign different resource IDs in the same DTIA topic.

- The id attribute set on the topic root element.
 - Important: You should ensure that these defined IDs are unique in the context of the entire DITA project. If the IDs are not unique, the transformation scenario will display warning messages in the transformation console output. In this case, the help system will not work properly.

- path Path to a corresponding WebHelp page. This path is relative to the location of the context-help-map.xml mapping file.
- productID ID of the product for which you are writing documentation. Applicable only if you are using **WebHelp** with Feedback transformations.
- productVersion Version of the product for which you are writing documentation. Applicable only if you are using **WebHelp with Feedback** transformations.

There are two ways of implementing context-sensitive help in your system:

- The XML mapping file can be loaded by a PHP script on the server side. The script receives the contextId value and will look it up in the XML file.
- Invoke one of the WebHelp system files index.html or index_frames.html and pass the contextId parameter with a specific value. The WebHelp system will automatically open the help page associated with the value of the contextId parameter.

The following example will open a *frameless* version of the WebHelp system showing the page associated with the id dialog1ID:

index.html?contextId=dialog1ID

The following example will open a *frameset* version of the WebHelp system showing the page associated with the id viewlID:

index_frames.html?contextId=view1ID

Customizing WebHelp Systems

To change the overall appearance of the WebHelp output, you can use the visual *WebHelp Skin Builder tool*, which does not require knowledge of CSS language.

If you are familiar with CSS and coding, this section includes topics that explain how you can customize your WebHelp system, such as how to improve the appearance of the Table of Contents, add logo images in the title area, remove the navigation buttons, and add custom headers and footers.

WebHelp Skin Builder

The **WebHelp Skin Builder** is a simple, easy-to-use tool, specially designed to assist users to visually customize the look and feel of the WebHelp output. It is implemented as an online tool hosted on the Oxygen XML Developer plugin website and allows you to experiment with different styles and colors over an inert documentation sample.

To be able to use the **Skin Builder**, you need:

- An Internet connection and unrestricted access to Oxygen XML Developer plugin website.
- A late version web browser.

To start the **Skin Builder**, do one of the following:

- For DocBook or DITA WebHelp systems, use a web browser to go to http://www.oxygenxml.com/webhelp-skin-builder.
- For DITA WebHelp systems, you can click the **Online preview** link in the *Skins tab* of a DITA OT transformation scenario. In the upper section of the preview, click the **Select Skin** button, then choose **Customize Skin**.

The Skin Builder Layout

The left side panel of the *Skin Builder* is divided into 3 sections:

• **Actions** - Contains the following two buttons:

- **Import** Opens an **Import CSS** dialog box that allows you to load a CSS stylesheet and apply it over the documentation sample.
- Export Saves all properties as a CSS file.
- Settings Includes a Highlight selection option that helps you identify the areas affected by a particular element
 customization.
 - When hovering an item in the customizable elements menu, the affected sample area is highlighted with a dotted blue border.
 - When an item in the customizable elements menu is selected, the affected sample area is highlighted with a solid red border.
- Customize Provides a series of customizable elements organized under four main categories:
 - Header
 - TOC Area
 - Vertical Splitter
 - Content

For each customizable element, you can alter properties such as background color or font face. Any alteration made in the customizable elements menu is applied in real time over the sample area.

Create a Customization Skin

- 1. The starting point can be either one of the predefined skins or a CSS stylesheet applied over the sample using the **Import** button.
- Use the elements in the Customize section to set properties that modify the look of the skin. By default, all customizable elements display a single property, but you can make more visible by clicking the + Add button and choosing from the available properties.
 - Note: If you want to revert a particular property to its initial value, press the Reset button.
- 3. When you are happy with the skin customizations you have made, press the **Export** button. All settings will be saved in a CSS file.

Apply a Customization Skin to a DITA Map to WebHelp Transformation Scenario

- 1. Start Oxygen XML Developer plugin.
- 2. Load the DITA map you want to produce as a WebHelp output.
- 3. Edit a *DITA Map to WebHelp*-type transformation scenario. Set the previously exported CSS file in the **Custom** section of the **Skins** tab.
- **4.** Run the transformation to obtain the WebHelp output.

Apply a Customization Skin to a DocBook to WebHelp Transformation Scenario

- 1. Start Oxygen XML Developer plugin.
- 2. Load the DocBook file you want to produce as a WebHelp output.
- 3. In the Parameters tab, set the webhelp.skin.css parameter to point to the previously exported CSS.
- 4. To customize the logo, use the following parameters: webhelp.logo.image (not available for the WebHelp Mobile transformation) and webhelp.logo.image.target.url (not available for the WebHelp Mobile transformation).
- 5. Run the transformation to obtain the WebHelp output.

Customizing WebHelp Output with a Custom CSS

By creating your own custom CSS stylesheet, you can customize the look and style of WebHelp output to fit your specific needs.

To use a custom CSS in WebHelp output, follow these steps:

- 1. Edit the WebHelp transformation scenario and open the Parameters tab.
 - a. For a DITA transformation, set the args.css parameter to the path of your custom CSS file. Also, set the args.copycss parameter to yes to automatically copy your custom CSS in the output folder when the transformation scenario is processed.
 - b. For a DocBook transformation, set the html.stylesheet parameter to the path of your custom CSS file.
- 2. Run the transformation scenario.

Changing the Style of WebHelp Mobile Pages

You can change the style for your WebHelp Mobile pages by setting a custom theme created with a third-party tool.

To create a custom theme for WebHelp Mobile pages, use the following procedure:

- 1. Create a custom theme (the result will be a CSS stylesheet). Use a designer tool, such as the *ThemeRoller for jQuery Mobile*, to create your own custom theme and then download the resulting CSS stylesheet.
 - Tip: If you are using ThemeRoller for jQuery Mobile, make sure you use a type C swatch.
- 2. Edit the WebHelp transformation scenario and open the Parameters tab.
 - a. For a DITA transformation, set the args.css parameter to the path of your custom CSS file. Also, set the args.copycss parameter to yes to automatically copy your custom CSS in the output folder when the transformation scenario is processed.
 - b. For a DocBook transformation, set the html.stylesheet parameter to the path of your custom CSS file.
- **3.** Make sure that the output folder is empty.
- **4.** Run the transformation scenario.

Integrating Social Media and Google Tools in WebHelp Output

Oxygen XML Developer plugin includes support for integrating some of the most popular social media sites in WebHelp output.

How to Add a Facebook Like Button in WebHelp Output

See how you can add a Facebook widget into your WebHelp output.

To add a Facebook[™] *Like* widget to your WebHelp output, follow these steps:

- 1. Go to the *Facebook Developers* website.
- Fill-in the displayed form, then click the Get Code button. A dialog box that contains code snippets is displayed.
- **3.** Copy the two code snippets and paste them into a *div* element inside an XML file called facebook-widget.xml.

Make sure you follow these rules:

- The file must be well-formed.
- The code for each script element must be included in an XML comment.
- The start and end tags for the XML comment must be on a separate line.

The content of the XML file should look like this:

```
data-share="true"/>
</div>
```

- 4. In Oxygen XML Developer plugin, click the **Configure Transformation Scenario(s)** action from the toolbar.
- **5.** Select an existing WebHelp transformation scenario (depending on your needs, it may be with or without feedback, or the mobile variant) and click the **Duplicate** button to open the **Edit Scenario** dialog box.
- **6.** Switch to the **Parameters** tab and edit the webhelp.footer.file parameter to reference the facebook-widget.xml file that you created earlier.
- Click Ok.
- 8. Run the transformation scenario.

How to Add Tweet Button in WebHelp Output

See how you can add a Twitter widget into your WebHelp output.

To add a Twitter[™] *Tweet* widget to your WebHelp output, follow these steps:

- **1.** Go to the *Tweet button generator* page.
- 2. Fill-in the displayed form.

The **Preview and code** area displays the code.

3. Copy the code snippet displayed in the **Preview and code** area and paste it into a div element inside an XML file called tweet-button.xml.

Make sure you follow these rules:

- The file must be well-formed.
- The code for each script element must be included in an XML comment.
- The start and end tags for the XML comment must be on a separate line.

The content of the XML file should look like this:

- 4. In Oxygen XML Developer plugin, click the Configure Transformation Scenario(s) action from the toolbar.
- 5. Select an existing WebHelp transformation scenario (depending on your needs, it may be with or without feedback, or the mobile variant) and click the **Duplicate** button to open the **Edit Scenario** dialog box.
- **6.** Switch to the **Parameters** tab and edit the webhelp.footer.file parameter to reference the tweet-button.xml file that you created earlier.
- 7. Click Ok.
- **8.** Run the transformation scenario.

How to Add a Google+ Button in WebHelp Output

See how you can add a Google+ widget into your WebHelp output.

To add a *Google*+ widget to your WebHelp output, follow these steps:

- **1.** Go to the *Google Developers* website.
- 2. Fill-in the displayed form.

The preview area on the right side displays the code and a preview of the widget.

3. Copy the code snippet displayed in the preview area and paste it into a div element inside an XML file called google-plus-button.xml.

Make sure that the content of the file is well-formed.

The content of the XML file should look like this:

```
<div id="google-plus">
  <!-- Place this tag in your head or just before your close body tag. -->
  <script src="https://apis.google.com/js/platform.js" async defer></script>

<!-- Place this tag where you want the +1 button to render. -->
  <div class="g-plusone" data-annotation="inline" data-width="300"></div>
</div>
```

- 4. In Oxygen XML Developer plugin, click the **Configure Transformation Scenario(s)** action from the toolbar.
- 5. Select an existing WebHelp transformation scenario (depending on your needs, it may be with or without feedback, or the mobile variant) and click the **Duplicate** button to open the **Edit Scenario** dialog box.
- **6.** Switch to the **Parameters** tab and edit the webhelp.footer.file parameter to reference the google-plus-button.xml file that you created earlier.
- 7. Click Ok.
- 8. Run the transformation scenario.

How to Integrate Google Search in WebHelp Output

See how you can integrate a Google Custom Search Engine into WebHelp output.

You can integrate Google Search into your WebHelp output.

To enable your WebHelp system to use Google Search, follow these steps:

- 1. Go to the Google Custom Search Engine page using your Google account.
- 2. Press the Create a custom search engine button.
- **3.** Follow the on-screen instructions to create a search engine for your site. At the end of this process you should obtain a code snippet.

A Google Search script looks like this:

- **4.** Save the script into a well-formed HTML file called googlecse.html.
- 5. In Oxygen XML Developer plugin, click the **Configure Transformation Scenario(s)** action from the toolbar.
- **6.** Select an existing WebHelp transformation scenario (depending on your needs, it may be with or without feedback, or the mobile variant) and click the **Duplicate** button to open the **Edit Scenario** dialog box.
- 7. Switch to the **Parameters** tab and edit the webhelp.google.search.script parameter to reference the googlecse.html file that you created earlier.
- **8.** You can also use the webhelp.google.search.results parameter to choose where to display the search results.
 - a) Create an HTML file that contains the Google Custom Search Engine element gcse: searchresults-only. It is recommended that you set the linkTarget attribute value to frm for frameless versions of the WebHelp

- system or to contentWin for *frameset* versions of WebHelp. The default value is _blank and if you do not specify a value the search results will be loaded in a new window.
- b) Set the value of the webhelp.google.search.results parameter to the location of the file you just created. If this parameter is not specified the following code is used: <gcse:searchresults-only linkTarget="frm"></gcse:searchresults-only>.

Click Ok.

10. Run the transformation scenario.

How to Integrate Google Analytics in WebHelp Output

See how you can integrate Google Analytics into WebHelp output.

To enable your WebHelp system to benefit from Google Analytics reports, follow these steps:

- 1. Create a new Google Analytics account (if you do not already have one) and log on.
- 2. Choose the Analytics solution that fits the needs of your website.
- 3. Follow the on-screen instructions to obtain a Tracking Code that contains your Tracking ID.

A Tracking Code looks like this:

```
<script>
  (function(i,s,o,g,r,a,m){i['GoogleAnalyticsObject']=r;i[r]=i[r]||function(){
  (i[r].q=i[r].q||[]).push(arguments)},i[r].l=1*new Date();a=s.createElement(o),
  m=s.getElementsByTagName(o)[0];a.async=1;a.src=g;m.parentNode.insertBefore(a,m)
})(window,document,'script','//www.google-analytics.com/analytics.js','ga');

ga('create', 'UA-XXXXXXXX-X', 'auto');
  ga('send', 'pageview');
</script>
```

- 4. Save the Tracking Code (obtained in the previous step) in a new HTML file called googleAnalytics.html.
- 5. In Oxygen XML Developer plugin, click the Configure Transformation Scenario(s) action from the toolbar.
- **6.** Select an existing WebHelp transformation scenario (depending on your needs, it may be with or without feedback, or the mobile variant) and click the **Duplicate** button to open the **Edit Scenario** dialog box.
- 7. Switch to the **Parameters** tab and edit the webhelp.footer.file parameter to reference the googleAnalytics.html file that you created earlier.
- 8. Click Ok.
- 9. Run the transformation scenario.

Localizing the Interface of WebHelp Output

You can localize the interface of WebHelp output for DITA or DocBook transformations.

How to Localize the Interface of WebHelp Output (for DITA Map Transformations)

Static labels that are used in the WebHelp output are kept in translation files in the DITA_OT_DIR/plugins/com.oxygenxml.webhelp/oxygen-webhelp/resources/localization

folder. Translation files have the *strings-lang1-lang2.xml* name format, where *lang1* and *lang2* are ISO language codes. For example, the US English text is kept in the *strings-en-us.xml* file.

To localize the interface of the WebHelp output for DITA map transformations, follow these steps:

- 1. Look for the *strings-[lang1]-[lang2].xml* file in DITA_OT_DIR/plugins/com.oxygenxml.webhelp/oxygen-webhelp/resources/localization directory (for example, the Canadian French file would be: *strings-fr-ca.xml*). If it does not exist, create one starting from the *strings-en-us.xml* file.
- 2. Translate all the labels from the above language file. Labels are stored in XML elements that have the following format: <str name="Label name">Caption</str>.
- 3. Make sure that the new XML file that you created in the previous two steps is listed in the file DITA_OT_DIR/plugins/com.oxygenxml.webhelp/oxygen-webhelp/resources/localization/strings.xml. In our example for the Canadian French file, it should be listed as: <lang xml:lang="fr-ca" filename="strings-fr-ca.xml"/>.

- **4.** Edit any of the **DITA Map to WebHelp** transformation scenarios (with or without feedback, or the mobile version) and set the args.default.language parameter to the code of the language you want to localize (for example, *fr-ca* for Canadian French).
- 5. Run the transformation scenario to produce the WebHelp output.

How to Localize the Interface of WebHelp Output (for DocBook Transformations)

Static labels that are used in the WebHelp output are kept in translation files in the [OXYGEN_DIR]/frameworks/docbook/xsl/com.oxygenxml.webhelp/oxygen-webhelp/resources/localization folder. Translation files have the *strings-lang1-lang2.xml* name format, where *lang1* and *lang2* are ISO language codes. For example, the US English text is kept in the *strings-en-us.xml* file.

To localize the interface of the WebHelp output for DocBook transformations, follow these steps:

- 1. Look for the <code>strings-[lang1]-[lang2].xml</code> file in <code>[OXYGEN_DIR]/frameworks/docbook/xsl/com.oxygenxml.webhelp/oxygen-webhelp/resources/localization</code> directory (for example, the Canadian French file would be: <code>strings-fr-ca.xml</code>). If it does not exist, create one starting from the <code>strings-en-us.xml</code> file.
- 2. Translate all the labels from the above language file. Labels are stored in XML elements that have the following format: caption
- 3. Make sure that the new XML file that you created in the previous two steps is listed in the file [OXYGEN_DIR]/frameworks/docbook/xsl/com.oxygenxml.webhelp/oxygen-webhelp/resources/localization/strings.xml. In our example for the Canadian French file, it should be listed as: <lang xml:lang="fr-ca" filename="strings-fr-ca.xml"/>.
- **4.** Edit any of the DocBook to WebHelp transformation scenarios (with or without feedback, or the mobile version) and set the l10n.gentext.default.language parameter to the code of the language you want to localize (for example, *fr-ca* for Canadian French).
- **5.** Run the transformation scenario to produce the WebHelp output.

Using the Oxygen XML WebHelp Plugin to Automate Output

Oxygen XML WebHelp plugin allows you to use a command line interface script to obtain WebHelp output from DITA and DocBook documents. Note that the Oxygen XML WebHelp plugin is a standalone product with its own licensing terms and cannot be used with a Oxygen XML Developer plugin license.

The WebHelp output files created with the Oxygen XML WebHelp plugin are the same as the output files produced when you run DITA or DocBook to WebHelp transformation scenarios from within Oxygen XML Developer plugin.

When an automated process is required due to the amount of output needed, do the following:

- 1. Install the Oxygen XML WebHelp plugin.
- 2. Acquire a Oxygen XML WebHelp license from http://www.oxygenxml.com/buy_webhelp.html.
- 3. Integrate the Oxygen XML WebHelp plugin with *DITA* or *DocBook*.

Oxygen XML WebHelp Plugin for DITA

To transform DITA documents using the Oxygen XML WebHelp plugin, first integrate the plugin with the DITA Open Toolkit. The purpose of the integration is to add the following transformation types to the DITA Open Toolkit:

- webhelp The transformation that produces WebHelp output for desktop.
- webhelp-feedback The transformation that produces feedback-enabled WebHelp for desktop.
- webhelp-mobile The transformations that produces WebHelp output for mobile devices.

Integrating the Oxygen XML WebHelp Plugin with the DITA Open Toolkit

This topic includes the procedure for integrating the Oxygen XML WebHelp plugin with the DITA Open Toolkit.

The requirements of the Oxygen XML WebHelp plugin for the DITA Open Toolkit are as follows:

- Java Virtual Machine 1.6 or later
- DITA Open toolkit 1.6.x, 1.7.x, 1.8, or 2.0 (Full Easy Install, includes Saxon 9.1.0.8 libraries)
- Saxon 9.1.0.8

To integrate the Oxygen XML WebHelp plugin with the DITA Open Toolkit, follow these steps:

- 1. Download and install a *Java Virtual Machine* 1.6 or later.
- 2. Download and install *DITA Open Toolkit* 1.6.x, 1.7.x, 1.8.x, or 2.x.
- 3. Go to Oxygen XML WebHelp website, download the latest installation kit, and unzip it.
- 4. Copy the com.oxygenxml.webhelp and com.oxygenxml.highlight directories inside the plugins directory of the DITA OT distribution. The com.oxygenxml.highlight directory adds syntax highlight capabilities to your WebHelp output for codeblock sections that contain source code snippets (XML, Java, JavaScript etc.).
- 5. If you are using DITA-OT version 2.x, the WebHelp plugin contains a plugin_2.x.xml which needs to be renamed to plugin.xml.
- **6.** In the home directory of the DITA Open Toolkit, run ant -f integrator.xml.
- 7. Go to http://sourceforge.net/projects/saxon/files/Saxon-B/9.1.0.8/, download the processor.saxonb9-1-0-8j.zip file (contains the Saxon 9.1.0.8), and unzip it to a destination of your choosing.

Licensing the Oxygen XML WebHelp Plugin for DITA OT

This topic explains how to register the license for the Oxygen XML WebHelp plugin for the DITA Open Toolkit.

To register the license for the Oxygen XML WebHelp plugin for the DITA Open Toolkit, follow these steps:

- 1. Open the [OXYGEN_DIR]/frameworks/dita/DIT-OT/plugins/com.oxygenxml.webhelp directory and create a file called licensekey.txt.
- 2. In this file, copy your license key which you purchased for your Oxygen XML WebHelp plugin.

 The WebHelp transformation process reads the Oxygen XML Developer plugin license key from this file. In case the file does not exit, or it contains an invalid license, an error message will be displayed.

Upgrading the Oxygen XML WebHelp Plugin for DITA OT

This topic describes the procedure for upgrading a Oxygen XML WebHelp plugin for the DITA Open Toolkit.

To upgrade your Oxygen XML WebHelp plugin for the DITA Open Toolkit, follow these steps:

- 1. Navigate to the plugins directory of your DITA OT distribution and delete the old Oxygen XML WebHelp plugin files (oxygen_custom.xsl, oxygen_custom_html.xsl) and directories (com.oxygenxml.highlight, com.oxygenxml.webhelp).
- 2. Go to Oxygen XML WebHelp website, download the latest installation kit, and unzip it.
- 3. Copy the com.oxygenxml.webhelp and com.oxygenxml.highlight directories inside the plugins directory of the DITA OT distribution. The com.oxygenxml.highlight directory adds syntax highlight capabilities to your WebHelp output for codeblock sections that contain source code snippets (XML, Java, JavaScript etc.).
- **4.** If you are using DITA-OT version 2.x, the WebHelp plugin contains a plugin_2.x.xml which needs to be renamed to plugin.xml.
- 5. In the home directory of the DITA Open Toolkit, run ant -f integrator.xml.

Running an External DITA Transformation Using the Oxygen XML WebHelp Plugin

This topic explains how to run an external DITA to WebHelp transformation using the Oxygen XML WebHelp plugin.

To run a DITA to WebHelp (webhelp, webhelp-feedback, webhelp-mobile) transformation using the Oxygen XML WebHelp plugin, use:

- The dita.bat script file for Windows based systems.
- The dita.sh script file for Unix/Linux based systems.
 - **Note:** You can call these files in an automated process or from the command line.
- Warning: You can also invoke the DITA OT WebHelp publishing using a startup script but you will lose certain small fixes and patches that Oxygen XML Developer plugin added to the automated DITA OT processing.

The dita.bat and the dita.sh files are located in the home directory of the Oxygen XML WebHelp Plugin. Before using them to generate a WebHelp system, customize them to match the paths to the JVM, DITA Open Toolkit, and Saxon engine, and also to set the transformation type. To do this, open the script file and edit the following variables and parameters:

- JVM_INSTALL_DIR Specifies the path to the Java Virtual Machine installation directory on your disk.
- DITA OT INSTALL DIR Specifies the path to DITA Open Toolkit installation directory on your disk.
 - 鬲

Note: The dita.bat and dita.sh scripts reference the dost-patches-DITA-1.8.jar JAR file containing DITA OT 1.8-specific patches. If you use DITA OT 1.7, update that reference to dost-patches-DITA-1.7.jar. If you use DITA OT 2.0, no patches are needed, so just remove the reference.

- SAXON_9_DIR Specifies the path to the directory on your disk where you unzipped the Saxon 9 archive files.
 - =

Note: If you are integrating the WebHelp plugin in a DITA OT distribution that comes with the included Saxon libraries, you can point directly to the Saxon libraries in the DITA OT distribution like this:

set SAXON_9_DIR=C:\path\to\DITA-OT1.8.5\lib\saxon

Otherwise, you can download the Saxon 9.1 JAR files from https://sourceforge.net/projects/saxon/files/Saxon-B/9.1.0.8/saxonb9-1-0-8j.zip/download.

- TRANSTYPE Specifies the type of the transformation you want to apply. You can set it to webhelp, webhelp-feedback and webhelp-mobile.
- DITA_MAP_BASE_DIR Specifies the path to the directory where the input DITA map file is located.
- DITAMAP_FILE Specifies the input DITA map file.
- DITAVAL_FILE Specifies the .ditaval input filter that the transformation process applies to the input DITA
 map file.
- DITAVAL_DIR Specifies the path to the directory where the .ditaval file is located.
- -Doutput.dir Specifies the output directory of the transformation.

The optional parameter -Dargs.filter can be used to specify a filter file to be used to include, exclude, or flag content.

Additional Oxygen XML WebHelp Plugin Parameters for DITA

You are able to append the following parameters to the command line that runs the transformation:

-Dwebhelp.sitemap.base.url

Base URL for all the loc elements in the generated sitemap.xml file. The value of a loc element is computed as the relative file path from the href attribute of a topicref element from the DITA map, appended to this base URL value. The loc element is mandatory in sitemap.xml. If you leave this parameter set to its default empty value, then the sitemap.xml file is not generated.

-Dwebhelp.sitemap.change.frequency

The value of the changefreq element in the generated sitemap.xml file. The changefreq element is optional in sitemap.xml. If you leave this parameter set to its default empty value, then the changefreq element is not added in sitemap.xml. Allowed values: <empty string> (default), always, hourly, daily, weekly, monthly, yearly, never.

-Dwebhelp.sitemap.priority

The value of the priority element in the generated sitemap.xml file. It can be set to any fractional number between 0.0 (least important priority) and 1.0 (most important priority), such as: 0.3, 0.5, 0.8, etc. The priority element is optional in sitemap.xml. If you leave this parameter set to its default empty value, then the priority element is not added in sitemap.xml.

-Dwebhelp.copyright

Adds a small copyright text that appears at the end of the Table of Contents pane.

Path to an XML file that includes the footer content for your WebHelp output pages. You can use this parameter to integrate social media features (such as widgets for FacebookTM, TwitterTM, Google Analytics, or Google+TM). The file must be well-formed, each widget must be in separate div or span element, and the code for each script element is included in an XML comment (also, the start and end tags for the XML comment must be on a separate line). The following code exert is an example for adding a FacebookTM widget:

-Dwebhelp.footer.include

Specifies whether or not to include footer in each WebHelp page. Possible values: yes, no. If set to no, no footer is added to the WebHelp pages. If set to yes and the webhelp.footer.file parameter has a value, then the content of that file is used as footer. If the webhelp.footer.file has no value then the default Oxygen XML Developer plugin footer is inserted in each WebHelp page.

-Dwebhelp.logo.image (not available for the WebHelp Mobile transformation)

Specifies a path to an image displayed as a logo in the left side of the output header.

-Dwebhelp.logo.image.target.url (not available for the WebHelp Mobile transformation)

Specifies a target URL that is set on the logo image. When you click the logo image, you will be redirected to this address.

-Dwebhelp.search.ranking (not available for the WebHelp Mobile transformation)

If this parameter is set to false then the *5-star rating mechanism* is no longer included in the search results that are displayed on the **Search** tab (default setting is true).

-Dwebhelp.search.japanese.dictionary

The file path of the dictionary that will be used by the *Kuromoji* morphological engine that Oxygen XML Developer plugin uses for indexing Japanese content in the WebHelp pages. This indexer does not come bundled with Oxygen XML Developer plugin or the Oxygen XML WebHelp plugin. To use it, you need to download it from http://mvnrepository.com/artifact/org.apache.lucene/lucene-analyzers-kuromoji/4.0.0 and add it in the DITA_OT_DIR/plugins/com.oxygenxml.webhelp/lib directory.

-Dwebhelp.google.search.script

Specifies the location of a well-formed XHTML file containing the Custom Search Engine script from Google. The value must be an URL.

-Dwebhelp.google.search.results

URL value that specifies the location of a well-formed XHTML file containing the Google Custom Search Engine element gcse:searchresults-only. You can use all supported attributes for this element. It is recommend to set the linkTarget attribute to frm for frameless (*iframe*) version of WebHelp or to contentWin for the frameset version of WebHelp. The default value for this attribute is _blank and the search results will be loaded in a new window. If this parameter is not specified, the following code will be used

<gcse:searchresults-only linkTarget="frm"></gcse:searchresults-only>

-Dwebhelp.product.id (available only for the WebHelp with Feedback transformation)

This parameter specifies a short name for the documentation target, or product (for example, mobile-phone-user-guide, hvac-installation-guide).

Note: You can deploy documentation for multiple products on the same server.

Note: The following characters are not allowed in the value of this parameter: $< > / \setminus '$ () { } = ; * % + &.

-Dwebhelp.product.version (available only for the WebHelp with Feedback transformation)

Specifies the documentation version number (for example, 1.0, 2.5, etc.). New user comments are bound to this version.

臣

Note: Multiple documentation versions can be deployed on the same server.

Ξ,

Note: The following characters are not allowed in the value of this parameter: $< > / \setminus '$ () $\{ \}$ = ; * % + &.

-Dwebhelp.skin.css (not available for the WebHelp Mobile transformation)

Path to a CSS file that sets the style theme in the output WebHelp pages. It can be one of the predefined skin CSS from the

OXYGEN_INSTALL_DIR\frameworks\docbook\xsl\com.oxygenxml.webhelp\predefined-skins directory, or it can be a custom skin CSS generated with the *Oxygen Skin Builder* web application.

=

Note: Note that the fix.external.refs.com.oxygenxml parameter is not supported in Oxygen XML WebHelp plugin.

If you need to further customize the transformation process, you are able to append other DITA-OT parameters as well. Any parameter that you want to append must follow the -D model of the above parameters. For example, to append the args.hdr parameter, use:

```
-Dargs.hdr=[HEADER_FILE_DIR]
```

where [HEADER_FILE_DIR] is the location of the directory that contains the header file.

Database Configuration for DITA WebHelp with Feedback

This topic explains where to find instructions for configuring the database that contains the user comments for a DITA WebHelp with Feedback system.

If you run the **webhelp-feedback** transformation using the WebHelp plugin, you need to configure the database that holds the user comments. The instructions for configuring the database are presented in the installation.html file, located at [DITA_MAP_BASE_DIR]/out/[TRANSFORM_TYPE]/oxygen-webhelp/resources. The installation.html file is created by the transformation process.

Oxygen XML WebHelp Plugin for DocBook

To transform DocBook documents using the Oxygen XML WebHelp plugin, first integrate the plugin with the DocBook XSL distribution. The purpose of the integration is to add the following transformation types to the DocBook XSL distribution:

- webhelp The transformation that produces WebHelp output for desktop.
- webhelp-feedback The transformation that produces feedback-enabled WebHelp for desktop.
- webhelp-mobile The transformations that produces WebHelp output for mobile devices.

Integrating the Oxygen XML WebHelp Plugin with the DocBook XSL Distribution

This topic includes the procedure for integrating the Oxygen XML WebHelp plugin with the DocBook XSL Distribution.

The WebHelp plugin transformations run as an Ant build script. The requirements are:

- Ant 1.8 or later
- Java Virtual Machine 1.6 later
- DocBook XSL 1.78.1 later
- Saxon 6.5.5
- Saxon 9.1.0.8

To integrate the Oxygen XML WebHelp plugin with the DocBook XSL distribution, follow these steps:

- 1. Download and install a *Java Virtual Machine* 1.6 or later.
- 2. Download and install Ant 8.0 or later.

- 3. Download and unzip on your computer the DocBook XSL distribution.
- 4. Unzip the Oxygen XML WebHelp distribution package in the DocBook XSL installation directory. The DocBook XSL directory now contains a new subdirectory named com.oxygenxml.webhelp and two new files, oxygen_custom.xsl and oxygen_custom_html.xsl.
- **5.** Download and unzip *saxon6-5-5.zip* on your computer.
- **6.** Download and unzip *saxonb9-1-0-8j.zip* on your computer.

Licensing the Oxygen XML WebHelp Plugin for DocBook

This topic explains how to register the license for the Oxygen XML WebHelp plugin for the DocBook XSL distribution.

To register the license for the Oxygen XML WebHelp plugin for the DocBook XSL distribution, follow these steps:

- Create a .txt file named license in the com.oxygenxml.webhelp subdirectory of the DocBook XSL directory.
- 2. In this file, copy the license key, which you purchased for your Oxygen XML WebHelp plugin.

 The WebHelp transformation process reads the Oxygen XML Developer plugin license key from this file. If the file does not exit, or it contains an invalid license, an error message is displayed.

Upgrading the Oxygen XML WebHelp Plugin for DocBook

This topic describes the procedure for upgrading a Oxygen XML WebHelp plugin for DocBook.

To upgrade your Oxygen XML WebHelp plugin for DocBook, follow these steps:

- Navigate to the [OXYGEN_DIR]/frameworks/docbook/xsl directory and delete the old Oxygen XML WebHelp plugin files (oxygen_custom.xsl, oxygen_custom_html.xsl) and directory (com.oxygenxml.webhelp).
- 2. Go to Oxygen XML WebHelp website, download the latest installation kit, and unzip it.
- 3. Copy the com.oxygenxml.webhelp directory in [OXYGEN_DIR]/frameworks/docbook/xsl.

Running an External DocBook Transformation Using the WebHelp Plugin

This topic explains how to run an external DocBook to WebHelp transformation using the Oxygen XML WebHelp plugin.

To run a DocBook to WebHelp (**webhelp**, **webhelp-feedback**, **webhelp-mobile**) transformation using the Oxygen XML WebHelp plugin, use:

- The docbook . bat script file for Windows based systems.
- The docbook . sh script file for Unix/Linux based systems.
 - **Note:** You can call these files in an automated process or from the command line.

The docbook.bat and the docbook.sh files are located in the home directory of the Oxygen XML WebHelp Plugin. Before using them to generate an WebHelp system, customize them to match the paths to the JVM, DocBook XSL distribution and Saxon engine, and also to set the transformation type. To do this, open a script file and edit the following variables:

- JVM INSTALL DIR Specifies the path to the Java Virtual Machine installation directory on your disk.
- ANT_INSTALL_DIR Specifies the path to the installation directory of Ant.
- SAXON 6 DIR Specifies the path to the installation directory of Saxon 6.5.5.
- SAXON_9_DIR Specifies the path to the installation directory of Saxon 9.1.0.8.
- DOCBOOK_XSL_DIR Specifies the path to the installation directory of the DocBook XSL distribution.
- TRANSTYPE Specifies the type of the transformation you want to apply. You can set it to webhelp, webhelp-feedback and webhelp-mobile.
- INPUT_DIR Specifies the path to the input directory, containing the input XML file.
- XML_INPUT_FILE Specifies the name of the input XML file.
- OUTPUT_DIR Specifies the path to the output directory where the transformation output is generated.
- DOCBOOK_XSL_DIR_URL Specifies the path to the directory of the DocBook XSL distribution in URL format.

Additional Oxygen XML WebHelp Plugin Parameters for DocBook

You are able to append the following parameters to the command line that runs the transformation:

- -Dwebhelp.copyright the copyright note (a text string value) that is added in the footer of the table of contents frame (the left side frame of the WebHelp output).
- -Dwebhelp.footer.file-specifies the location of a well-formed XHTML file containing your custom footer for the document body. Corresponds to the WEBHELP_FOOTER_FILE XSLT parameter. The fragment must be an well-formed XHTML, with a single root element. As a common practice, place all the content inside a <div> element.
- -Dwebhelp.footer.include specifies whether the content of file set in the -Dwebhelp.footer.file is used as footer in the WebHelp pages. Its values can be yes, or no.
- -Dwebhelp.product.id-the value of this parameter is a text string, that the **webhelp-feedback** transformation requires. It represents a short name of the documentation target (product). All the user comments that are posted in the WebHelp output pages and are added in the comments database are bound to this product ID.
 - **Note:** You can deploy documentation for multiple products on the same server.
- -Dwebhelp.product.version the value of this parameter is a text string, that the **webhelp-feedback** transformation requires. It specifies the documentation version number (for example, 1.0, 2.5, etc.) New user comments are bound to this version.
 - Note: Multiple documentation versions can be deployed on the same server.

If you need to further customize your transformation, other DocBook XSL parameters can be appended. Any parameter that you want to append must follow the -D model of the above parameters. For example, you can append the html.stylesheet parameter in the following form:

-Dhtml.stylesheet=/path/to/directory/of/stylesheet.css

Database Configuration for DocBook WebHelp with Feedback

This topic explains where to find instructions for configuring the database that contains the user comments for a DocBook WebHelp with Feedback system.

If you run the **webhelp-feedback** transformation using the WebHelp plugin, you need to configure the database that holds the user comments. The instructions for configuring the database are presented in the installation.html file, located at [OUTPUT_DIR]/oxygen-webhelp/resources/installation.html. The installation.html file is created by the transformation process.

Localizing the Email Notifications of the WebHelp with Feedback System

The WebHelp with Feedback system uses emails to notify users when comments are posted. These emails are based on templates stored in the WebHelp directory. The default messages are in English, French, German, and Japanese. These messages are copied into the WebHelp system deployment directory during the execution of the corresponding transformation scenario.

Suppose that you want to localize the emails into Dutch (nl). Follow these steps:

DocBook to WebHelp with Feedback

1. Create the following directory:

[OXYGEN_DIR]\frameworks\docbook\xs1\com.oxygenxml.webhelp\oxygen-webhelp\resources\php\templates\nl

- 2. Copy all English template files from [OXYGEN_DIR]\frameworks\docbook\xsl\com.oxygenxml.webhelp\oxygen-webhelp\resources\php\templates\en and paste them into the directory you just created.
- $\label{lem:content_of_content} \begin{tabular}{ll} \textbf{Solution} & \textbf{Sol$

- 4. Start Oxygen XML Developer plugin and edit the WebHelp with Feedback transformation scenario.
- 5. In the **Parameters** tab, look for the 110n.gentext.default.language parameter and set its value to the appropriate language code. In our example, use the value nl for Dutch.
 - 區

Note: If you set the parameter to a value such as LanguageCode-CountryCode (for example, en-us), the transformation scenario will only use the language code

6. Run the transformation scenario to obtain the WebHelp with Feedback output.

DITA to WebHelp with Feedback

1. Create the following directory:

DITA_OT_DIR\plugins\com.oxygenxml.webhelp\oxygen-webhelp\resources\php\templates\nl

- 2. Copy all English template files from DITA_OT_DIR\plugins\com.oxygenxml.webhelp\oxygen-webhelp\resources\php\templates\en and paste them into the directory you just created.
- 3. Edit the HTML files from the DITA_OT_DIR\plugins\com.oxygenxml.webhelp\oxygen-webhelp\resources\php\templates\nl directory and translate the content into Dutch.
- 4. Start Oxygen XML Developer plugin and edit the WebHelp with Feedback transformation scenario.
- 5. In the **Parameters** tab, look for the args.default.language parameter and set its value to the appropriate language code. In our example, use the value nl for Dutch.
 - Note: If you set the parameter to a value such as LanguageCode-CountryCode (for example, en-us), the transformation scenario will only use the language code
- **6.** Run the transformation scenario to obtain the WebHelp with Feedback output.

Editing Scoring Values of Tag Elements in Search Results

The WebHelp **Search** feature is enhanced with a rating mechanism that computes scores for every page that matches the search criteria. HTML tag elements are assigned a scoring value and these values are evaluated for the search results. Oxygen XML Developer plugin includes a properties file that defines the scoring values for tag elements and this file can be edited to customize the values according to your needs.

To edit the scoring values of HTML tag element for enhancing WebHelp search results, follow these steps:

- 1. Edit the scoring properties file for DITA or DocBook WebHelp systems. The properties file includes instructions and examples to help you with your customization.
 - a) For DITA WebHelp systems, edit the following file: DITA_OT_DIR\plugins\com.oxygenxml.webhelp\indexer\scoring.properties.
 - b) For DocBook WebHelp system, edit the following file: [OXYGEN_DIR]\frameworks\docbook\xsl\com.oxygenxml.webhelp\indexer\scoring.properties.

The values that can be edited in the scoring.properties file:

```
h1 = 10

h2 = 9

h3 = 8

h4 = 7

h5 = 6

h6 = 5

b = 5

strong = 5

em = 3

i=3

u=3

div.toc=-10

title=20

div.ignore=ignored

meta_keywords = 20

meta_indexterms = 20

meta_description = 25

shortdesc=25
```

- **2.** Save your changes to the file.
- 3. Re-run your WebHelp system transformation scenario.

Adding Videos in the Output

Videos can be included and played in all HTML5-based output formats (such as *WebHelp*). For example, to add a YouTube video in the WebHelp output generated from DITA or DocBook documents, follow the procedures below.

Adding Videos to WebHelp Generated from DITA Maps

1. Edit the DITA topic to reference the video using an object element, as in the following example:

```
<object outputclass="video">
  <param name="src" value="http://www.youtube.com/watch/v/VideoName"/>
</object>
```

2. Apply a WebHelp or WebHelp with Feedback transformation scenario to obtain the output.

Adding Videos to WebHelp Generated from DocBook

1. Edit the DocBook document and reference the video using an mediaobject element, as in the following example:

```
<mediaobject>
  <videoobject>
     <videodata fileref="http://www.youtube.com/watch/v/VideoName"/>
     </videoobject>
</mediaobject>
```

2. Apply a WebHelp or WebHelp with Feedback transformation scenario to obtain the output.

Changing the Icons in a WebHelp Table of Contents

You can change the icons that appear in a WebHelp table of contents by assigning new image files in a custom CSS file. By default, the icons for the WebHelp table of contents are defined with the following CSS codes (the first example is the icon that appears for a collapsed menu and the second for an expanded menu):

```
.hasSubMenuClosed{
   background: url('../img/book_closed16.png') no-repeat;
   padding-left: 16px;
   cursor: pointer;
}

.hasSubMenuOpened{
   background: url('../img/book_opened16.png') no-repeat;
   padding-left: 16px;
   cursor: pointer;
}
```

To assign different icons use the following procedure:

Create a custom CSS file that assigns your desired icons to the . hasSubMenuClosed and . hasSubMenuOpened properties.

```
.hasSubMenuClosed{
    background: url('TOC-my-closed-button.png') no-repeat;
}
.hasSubMenuOpened{
    background: url('TOC-my-opened-button.png') no-repeat;
}
```

- 2. It is recommended that you store the image files in the same directory as the default icons.
 - a) For DITA transformations: DITA_OT_DIR\plugins\com.oxygenxml.webhelp\oxygen-webhelp\resources\img\.
 - b) For DocBook transformations: [OXYGEN_INSTALL_DIR]\frameworks\docbook\xs1\com.oxygenxml.webhelp\oxygen-webhelp\resources\img\.
- **3.** Edit the WebHelp transformation scenario and open the **Parameters** tab.

- a) For a DITA transformation, set the args.css parameter to the path of your custom CSS file. Also, set the args. copycss parameter to yes to automatically copy your custom CSS in the output folder when the transformation scenario is processed.
- b) For a DocBook transformation, set the html.stylesheet parameter to the path of your custom CSS file.
- **4.** Run the transformation scenario.

Customize the Appearance of Selected Items in the Table of Contents

The appearance of selected items in the Table of Contents can be enhanced.

For example, to highlight the background of the selected item, follow these steps:

- 1. Locate the toc.css file in the following directory:
 - **a.** For DITA transformations:

```
DITA_OT_DIR\plugins\com.oxygenxml.webhelp\oxygen-webhelp\resources\css.
```

- **b.** For DocBook transformations: [OXYGEN_DIR]\frameworks\docbook\xsl\com.oxygenxml.webhelp\oxygen-webhelp\resources\css.
- 2. Edit that CSS file, find the menuItemSelected class, and change the value of the background property.

Note: You can also overwrite the same value from your own custom CSS and then specify the path to your CSS in the transformation scenario (see step 3 in the *Changing the Icons in a WebHelp Table of Contents* topic.

Adding a Logo Image in the Title Area

You can customize the title area of your WebHelp output by using a custom CSS.

For example, to add a logo image before the title, you could use the following code:

```
#header h1:before {
   display: inline;
    content:url('oxygen-webhelp/resources/img/myLogoImage.gif');
```

In the example above, myLogoImage.gif is an image file that you need to store in an images directory from which it will be copied automatically by the WebHelp transformation to the output directory.

It is recommended that you store the image files in the same directory as the default icons.

- For DITA transformations: DITA_OT_DIR\plugins\com.oxygenxml.webhelp\oxygen-webhelp\resources\img\.
- For DocBook transformations: [OXYGEN_INSTALL_DIR]\frameworks\docbook\xs1\com.oxygenxml.webhelp\oxygen-webhelp\resources\img\.

Then you need to specify the path of your custom CSS in the transformation scenario.

Edit the WebHelp transformation scenario and open the Parameters tab.

- For a DITA transformation, set the args.css parameter to the path of your custom CSS file. Also, set the args.copycss parameter to yes to automatically copy your custom CSS in the output folder when the transformation scenario is processed.
- For a DocBook transformation, set the html.stylesheet parameter to the path of your custom CSS file.

Removing the Previous/Next Links from WebHelp Pages

The **Previous** and **Next** links that are created at the top area of each WebHelp page can be hidden with a CSS code.

To remove these links from WebHelp pages, follow these steps:

1. Add the following CSS code in a custom CSS stylesheet:

```
.navparent, .navprev, .navnext {
   visibility:hidden;
```

2. Edit the WebHelp transformation scenario and open the Parameters tab.

- a. For a DITA transformation, set the args.css parameter to the path of your custom CSS file. Also, set the args.copycss parameter to yes to automatically copy your custom CSS in the output folder when the transformation scenario is processed.
- b. For a DocBook transformation, set the html.stylesheet parameter to the path of your custom CSS file.
- **3.** Run the transformation scenario.

Customizing the Header and Footer

In the transformation scenario, you can use the args.hdr and args.ftr parameters to point to resources that contain your custom HTML <div> blocks. These are included in the header and footer of each generated topic.

As a practical example, to hide the horizontal separator line between the content and footer, follow these steps:

1. Create a custom CSS file that contains the following snippet:

```
.footer_separator {
  display:none;
}
```

- 2. Edit the WebHelp transformation scenario and open the Parameters tab.
 - **a.** For a DITA transformation, set the args.css parameter to the path of your custom CSS file. Also, set the args.copycss parameter to yes to automatically copy your custom CSS in the output folder when the transformation scenario is processed.
 - b. For a DocBook transformation, set the html.stylesheet parameter to the path of your custom CSS file.
- 3. Run the transformation scenario.

Adding a Favicon in WebHelp Systems

You can add a custom *favicon* to your WebHelp system by simply editing a template in an XSL file. To add a *favicon*, follow these steps:

- 1. Edit the following XSL file for DITA or DocBook WebHelp systems:
 - a) For DITA WebHelp systems, edit the following file: DITA_OT_DIR\plugins\com.oxygenxml.webhelp\xsl\createMainFiles.xsl.
 - b) For DocBook WebHelp system, edit the following file: [OXYGEN_DIR]\frameworks\docbook\xsl\com.oxygenxml.webhelp\xsl\createMainFiles.xsl.
- 2. Locate the following template in the XSL file: <xsl:template name-"create-toc-common-file">.
- 3. Add two link elements inside the head element, as in the following example:

```
<link rel="icon" href="/favicon.ico" type="image/x-icon" />
<link rel="shortcut icon" href="/favicon.ico" type="image/x-icon" />
```

- **4.** Save your changes to the file.
- **5.** Re-run your WebHelp system transformation scenario.

Change Numbering Styles for Ordered Lists

Ordered lists (o1) are usually numbered in XHTML output using numerals. If you want to change the numbering to alphabetical, follow these steps:

1. Define a custom outputclass value and set it as an attribute of the ordered list, as in the following example:

```
     >A
     >B
     C
     C
```

2. Add the following code snippet in a custom CSS file:

```
ol.number-alpha{
    list-style-type:lower-alpha;
}
```

- 3. Edit the WebHelp transformation scenario and open the Parameters tab.
 - a. For a DITA transformation, set the args.css parameter to the path of your custom CSS file. Also, set the args.copycss parameter to yes to automatically copy your custom CSS in the output folder when the transformation scenario is processed.
 - b. For a DocBook transformation, set the html.stylesheet parameter to the path of your custom CSS file.
- **4.** Run the transformation scenario.

WebHelp Runtime Additional Parameters

A deployed WebHelp system can accept the following GET parameters:

- log The value can be true or false (default value). When set to true, it enables JavaScript debugging.
- contextId The WebHelp JavaScript engine will look up the value of this parameter in the mapping file and load the corresponding HTML help page. For more information, see the *Context-Sensitive WebHelp System* topic.

- toc.visible The value can be true (default value) or false. When set to false, the table of contents will be collapsed when you load the WebHelp page.
- searchQuery You can use this parameter to perform a search operation when WebHelp is loaded. For example, if you want to open WebHelp showing all search results for *growing flowers*, the URL should look like this: http://localhost/webhelp/index.html?searchQuery=growing%20flowers.

Disable Caching in WebHelp Pages

Sometimes, a set of WebHelp pages needs to be updated often in order to deliver the latest version of the documentation to your users. In such cases, a WebHelp page should always be requested from the server upon re-loading it in a Web browser on the client side, rather than re-using an outdated *cached* version in the browser.

To disable caching in WebHelp pages, follow this procedure:

- 1. Edit the following XSL file for DITA or DocBook WebHelp systems:
 - For DITA WebHelp systems, edit the following file: DITA_OT_DIR\plugins\com.oxygenxml.webhelp\xsl\createMainFiles.xsl.
 - For DocBook WebHelp system, edit the following file: [OXYGEN_DIR]\frameworks\docbook\xsl\com.oxygenxml.webhelp\xsl\createMainFiles.xsl.
- 2. Locate the following template in the XSL file: <xsl:template name-"create-toc-common-file"> and add the following code snippet:

```
<meta http-equiv="Pragma" content="no-cache" />
<meta http-equiv="Expires" content="-1" />
```

Note: The code should look like this:

- **3.** Save your changes to the file.
- **4.** Re-run your WebHelp system transformation scenario.

Adding a Button in Code Snippet Areas

This task will get you started on how to add an action (such as a button or link) in code snippet areas that are displayed in WebHelp output. You can then attach your code that does the actual processing for the action.

Follow these steps:

- 1. Open the DITA_OT_DIR\plugins\org.dita.xhtml\xsl\xslhtml\dita2htmlImpl.xsl file.
- 2. Locate the <xsl:template match="*[contains(@class, 'topic/pre')]" mode="pre-fmt"> template to check the default behavior of this template.
- 3. Open the DITA_OT_DIR\plugins\com.oxygenxml.webhelp\xsl\dita\desktop\fixup.xsl file.
- 4. Create a <xsl:template match="*[contains(@class, 'topic/pre')]" mode="pre-fmt"> template to override the default processing.
- **5.** This new template will include your code for creating the button, which will have the action code that does the actual processing attached to it (this can be written in JavaScript, for example).

Example of a *Select all* button:

Flag DITA Content

Flagging content involves defining a set of images that will be used for marking content across your information set.

To flag DITA content, you need to create a filter file that defines properties that will be applied on elements to be flagged. Generally, flagging is supported for block-level elements (such as paragraphs), but not for phrase-level elements within a paragraph. This ensures that the images that will flag the content are easily scanned by the reader, instead of being buried in text.

Follow this procedure:

- 1. Create a DITA filter file in the directory where you want to add the file. Give the file a descriptive name, such as audience-flag-build.ditaval.
- 2. Define the property of the element you want to be flagged. For example, if you want to flag elements that have the audience attribute set to programmer, the content of the DITAVAL file should look like in the following example:

Note that for an element to be flagged, at least one attribute-value pair needs to have a property declared in the DITAVAL file.

- 3. Specify the DITAVAL file in the **Filters** tab of the transformation scenario.
- 4. Run the transformation scenario.

Querying Documents

Topics:

- Running XPath Expressions
- Working with XQuery

This chapter shows how to query XML documents in Oxygen XML Developer plugin with XPath expressions and the XQuery language.

Running XPath Expressions

This section covers the views, toolbars, and dialog boxes in Oxygen XML Developer plugin that are dedicated to running XPath expressions.

What is XPath

XPath is a language for addressing specific parts of an XML document. XPath, like the Document Object Model (DOM), models an XML document as a tree of nodes. An XPath expression is a mechanism for navigating through and selecting nodes from the XML document. An XPath expression is, in a way, analogous to an SQL query used to select records from a database.

There are different types of nodes, including element nodes, attribute nodes and text nodes. XPath defines a way to compute a string-value for each type of node.

XPath defines a library of standard functions for working with strings, numbers and boolean expressions.

- child:: * Selects all children of the root node.
- . / /name Selects all elements having the name "name", descendants of the current node.
- /catalog/cd[price>10.80] Selects all the cd elements that have a price element with a value larger than 10.80.

To find out more about XPath, go to http://www.w3.org/TR/xpath.

The XPath/XQuery Builder View

The **XPath/XQuery Builder** view allows you to compose complex XPath and XQuery expressions and execute them over the currently edited XML document. For XPath 2.0 / 3.0, or XQuery expressions, you are able to use the doc() function to specify the source file over which the expressions are executed. When you connect to a database, the expressions are executed over that database. If you are using the XPath/XQuery Builder view and the current file is an XSLT document, Oxygen XML Developer plugin executes the expressions over the XML document in the associated scenario.

To open the XPath/XQuery Builder view, go to Window > Show View > XPath/XQuery Builder.

The upper part of the view contains the following actions:

- A drop-down menu that allows you to select the type of the expression you want to execute. You can choose between:
 - XPath 1.0 (Xerces-driven)
 - XPath 2.0, XPath 2.0SA, XPath 3.0, XPath 3.0SA, XQuery 1.0, XQuery 3.0, Saxon-HE XQuery, Saxon-PE XQuery, or Saxon-EE XQuery (all of them are Saxon-driven)
 - Custom connection to XML databases that can execute XQuery expressions
 - Note: The results returned by XPath 2.0 SA and XPath 3.0 SA have a location limited to the line number of the start element (there are no column information and no end specified).
 - **Note:** Oxygen XML Developer plugin uses Saxon to execute XPath 3.0 expressions. Since Saxon implements a part of the 3.0 functions, when using a function that is not implemented, Oxygen XML Developer plugin returns a compilation error.
- **Execute XPath** button Press this button to start the execution of the XPath or XQuery expression you are editing. The result of the execution is displayed in the *Results view* in a separate tab
- Favorites button Allows you to save certain expressions that you can later reuse. To add an expression as favorite, press the star button and enter a name under which the expression is saved. The star turns yellow to confirm that the expression was saved. Expand the drop-down menu next to the star button to see all your favorites. Oxygen XML Developer plugin automatically groups favorites in folders named after the method of execution

- History drop-down menu Keeps a list of the last 15 executed XPath or XQuery expressions. Use the Clear history action from the bottom of the list to remove them
- Settings drop-down menu Contains the following three options:
 - **Update on caret move** When enabled and you navigate through a document, the XPath expression corresponding to the XML node at the current cursor position is displayed.
 - Evaluate as you type When you select this option, the XPath expression you are composing is evaluated in real time.
 - Note: The Evaluate as you type option and the automatic validation are disabled when the scope is other than Current file.
 - Options Opens the Preferences page of the currently selected processing engine.
- **XPath scope** menu Oxygen XML Developer plugin allows you to define a scope on which the XPath operation will be executed. You can choose where the XPath expression will be executed:
 - Current file Current selected file only.
 - Enclosing project All the files of the project that encloses the current edited file.
 - Workspace selected files The files selected in the workspace. The files are collected from the last selected resource provider view (Navigator, Project Explorer or Package Explorer).
 - All opened files All files opened in the application.

 - Working sets The selected working sets.

At the bottom of the scope menu there are available the following scope configuration actions:

- Configure XPath working sets Allows you to configure and manage collections of files and folders, encapsulated in logical containers called *working sets*.
- XPath file filter You can filter the files from the selected scope on which the XPath expression will be executed. By default the XPath expression will be executed only on XML files, but you can also define a set of patterns that will filter out files from the current scope.

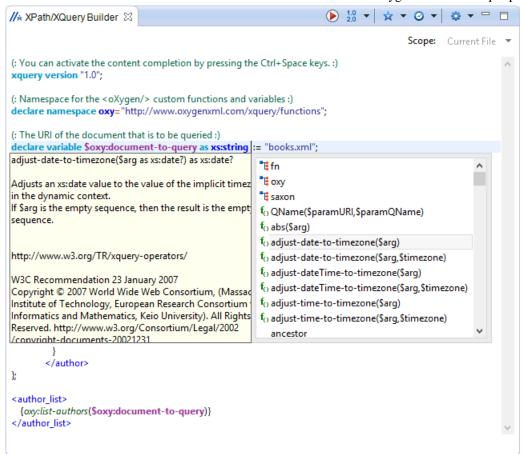

Figure 193: The XPath/XQuery Builder View

When you hover your cursor over the XPath/XQuery version icon $\frac{1.0}{2.0}$, a tooltip is displayed to let you know what engine Oxygen XML Developer plugin currently uses.

While you edit an XPath or XQuery expression, Oxygen XML Developer plugin assists you with the following features:

- Content Completion Assistant It offers context-dependent proposals and takes into account the cursor position in the document you are editing. The set of functions proposed by the **Content Completion Assistant** also depends on the engine version. Select the engine version from the drop-down menu available in the toolbar.
- Syntax Highlight Allows you to identify the components of an expression. To customize the colors of the components of the expression, *open the Preferences dialog box* and go to *Editor* > *Syntax Highlight*.
- Automatic validation of the expression as you type.
 - Note: When you type invalid syntax a red serrated line underlines the invalid fragments.
- Function signature and documentation balloon, when the cursor is located inside a function.

XPath Expression Results

When you run an XPath expression, Oxygen XML Developer plugin displays the results of its execution in the **XPath Results** view.

This view contains the following columns:

- **Description** Holds the result thatOxygen XML Developer plugin displays when you run an XPath expression.
- **XPath location** Holds the path to the matched node.
- Resource Holds the name of the document on which you run the XPath expression.

- System ID Holds the path to the document itself.
- Location Holds the location of the result in the document.

To arrange the results depending on a column, click its header. If no information regarding location is available, Oxygen XML Developer plugin displays **Not available** in the **Location** column. Oxygen XML Developer plugin displays the results in a valid XPath expression format.

- /node[value]/node[value] -

Figure 194: XPath results highlighted in editor panel with character precision

The following snippets are taken from a DocBook book based on the DocBook XML DTD. The book contains a number of chapters. To return all the chapter nodes of the book, enter //chapter in the XPath expression field and press (Enter). This action returns all the chapter nodes of the DocBook book in the Results View. Click a record in the Results View to locate and highlight its corresponding chapter element and all its children nodes in the document you are editing.

To find all example nodes contained in the sect2 nodes of a DocBook XML document, use the following XPath expression: //chapter/sect1/sect2/example. Oxygen XML Developer plugin adds a result in the **Results View** for each example node found in any sect2 node.

For example, if the result of the above XPath expression is:

```
- /chapter[1]/sect1[3]/sect2[7]/example[1]
```

it means that in the edited file the example node is located in the first chapter, third section level one, seventh section level 2.

Catalogs

The evaluation of the XPath expression tries to resolve the locations of documents referenced in the expression through the *XML catalogs*. These catalogs are *configured in the Preferences* pages and *the current XInclude preferences*.

As an example, consider the evaluation of the collection (URIofCollection) function (XPath 2.0). To resolve the references from the files returned by the collection () function with an XML

catalog, specify the class name of the XML catalog enabled parser for parsing these collection files. The class name is ro.sync.xml.parser.CatalogEnabledXMLReader.Specify it as it follows:

```
let $docs := collection(iri-to-uri(
    "file:///D:/temp/test/XQuery-catalog/mydocsdir?recurse=yes;select=*.xml;
    parser=ro.sync.xml.parser.CatalogEnabledXMLReader"))
```

XPath Prefix Mapping

To define default mappings between prefixes (that you can use in the XPath toolbar) and namespace URIs *go to* *** XPath Options preferences panel** and enter the mappings in the **Default prefix-namespace mappings** table. The same preferences panel allows you to configure the default namespace used in XPath 2.0 expressions.

Important: If you define a default namespace, Oxygen XML Developer plugin binds this namespace to the first free prefix from the list: default, default1, default2, and so on. For example, if you define the default namespace xmlns="something" and the prefix default is not associated with another namespace, you can match tags without prefix in an XPath expression typed in the XPath toolbar by using the prefix default. To find all the level elements when you define a default namespace in the root element, use this expression: //default:level in the XPath toolbar.

Working with XQuery

This section explains how to edit and run XQuery queries in Oxygen XML Developer plugin.

What is XQuery

XQuery is the query language for XML and is officially defined by *a W3C Recommendation document*. The many benefits of XQuery include:

- XQuery allows you to work in one common model no matter what type of data you're working with: relational, XML, or object data.
- XQuery is ideal for queries that must represent results as XML, to query XML stored inside or outside the database, and to span relational and XML sources.
- XQuery allows you to create many different types of XML representations of the same data.
- XQuery allows you to query both relational sources and XML sources, and create one XML result.

Syntax Highlight and Content Completion

To *create an XQuery document*, select **File** > **New** (<u>Ctrl</u> (<u>Meta on Mac OS</u>)+N) and when the **New** document wizard appears, select XQuery entry.

Oxygen XML Developer plugin provides syntax highlight for keywords and all known XQuery functions and operators. A content completion assistant is also available and can be activated with the (Ctrl (Meta on Mac OS)+Space) shortcut. The functions and operators are presented together with a description of the parameters and functionality. For some supported database engines like eXist and Berkeley DB, the content completion list offers the specific XQuery functions implemented by that engine. This feature is available when the XQuery file has an associated transformation scenario which uses one of these database engines or the XQuery validation engine is set to one of them via a validation scenario or in the XQuery Preferences page.

The extension functions built in the Saxon product are available on content completion if one of the following conditions are true:

- The edited file has a transformation scenario associated that uses as transformation engine Saxon 9.6.0.7 PE or Saxon 9.6.0.7 EE.
- The edited file has a validation scenario associated that use as validation engine Saxon 9.6.0.7 PE or Saxon 9.6.0.7 EE.

• The validation engine specified in *Preferences* is Saxon 9.6.0.7 PE or Saxon 9.6.0.7 EE.

If the Saxon namespace (http://saxon.sf.net) is mapped to a prefix the functions are presented using this prefix, the default prefix for the Saxon namespace (saxon) is used otherwise.

If you want to use a function from a namespace mapped to a prefix, just type that prefix and the content completion displays all the XQuery functions from that namespace. When the default namespace is mapped to a prefix the XQuery functions from this namespace offered by content completion are also prefixed, only the function name being used otherwise.

The content completion popup window presents all the variables and functions from both the edited XQuery file and its imports.

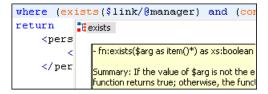

Figure 195: XQuery Content Completion

XQuery Outline View

The XQuery document structure is presented in the XQuery **Outline** view. The outline tree presents the list of all the components (namespaces, imports, variables, and functions) from both the edited XQuery file and its imports. It allows quick access to components and can be opened from **Window** > **Show View** > **Outline**.

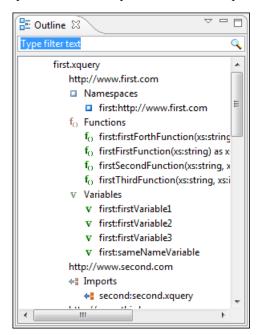

Figure 196: XQuery Outline View

The following actions are available in the **View menu** on the **Outline** view action bar:

Selection update on cursor move

Controls the synchronization between **Outline** view and source document. The selection in the **Outline** view can be synchronized with the cursor moves or the changes performed in the XQuery editor. Selecting one of the components from the **Outline** view also selects the corresponding item in the source document.

Sort Sort

Allows you to alphabetically sort the XQuery components.

Show all components

Displays all collected components starting from the current file. This option is set by default.

Show only local components

Displays the components defined in the current file only.

Group by location/namespace/type

Allows you to group the components by location, namespace, and type. When grouping by namespace, the main XQuery module namespace is presented first in the **Outline** view.

If you know the component name, you can search it in the **Outline** view by typing its name in the filter text field from the top of the view or directly on the tree structure. When you type the component name in the filter text field you can switch to the tree structure using the arrow keys of the keyboard, (**Enter**), (**Tab**), (**Shift-Tab**). To switch from tree structure to the filter text field, you can use (**Tab**), (**Shift-Tab**).

Tip: The search filter is case insensitive. The following wildcards are accepted:

- * any string
- ? any character
- , patterns separator

If no wildcards are specified, the string to search is used as a partial match (like *textToFind*).

The upper part of the **Outline** view contains a filter box that allows you to focus on the relevant components. Type a text fragment in the filter box and only the components that match it are presented. For advanced usage you can use wildcard characters (*, ?) and separate multiple patterns with commas.

The XQuery Input View

You are able to drag and drop a node in the editing area to insert XQuery expressions quickly.

XQuery Validation

With Oxygen XML Developer plugin, you can validate your documents before using them in your transformation scenarios. The validation uses the Saxon 9.6.0.7 PE processor or the 9.6.0.7 EE, IBM DB2, eXist, Berkeley DB XML, Documentum xDb (X-Hive/DB) 10, or MarkLogic (version 5 or newer) if you installed them. Any other XQuery processor that offers an XQJ API implementation can also be used. This is in conformance with the XQuery Working Draft. The processor is used in two cases: validation of the expression and execution. Although the execution implies a validation, it is faster to check the expression syntactically, without executing it. The errors that occurred in the

Figure 199: XQuery Input Drag and Drop Result

document are presented in the messages view at the bottom of editor window, with a full description message. As with all error messages, if you click an entry, the line where the error appeared is highlighted.

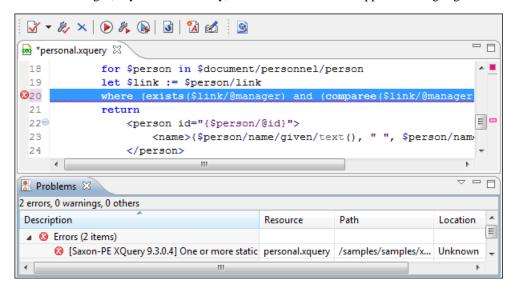

Figure 200: XQuery Validation

Note: If you choose a processor that does not support XQuery validation, Oxygen XML Developer plugin displays a warning when trying to validate.

When you open an XQuery document from a connection that supports validation (for example MarkLogic, or eXist), by default Oxygen XML Developer plugin uses this connection for validation. If you open an XQuery file using a MarkLogic connection, the validation better resolves imports.

Transforming XML Documents Using XQuery

XQueries are similar with the XSL stylesheets, both being capable of transforming an XML input into another format. You specify the input URL when you *define the transformation scenario*. The result can be saved and opened in the associated application. You can even run a *FO processor* on the output of an XQuery. The transformation scenarios may be shared between many XQuery files, are *exported* together with the XSLT scenarios and can be managed in *the Configure Transformation Scenario dialog box*, or in *the Scenarios view*. The transformation can be performed on the XML document specified in the **XML URL** field, or, if this field is empty, the documents referenced from the query expression. The parameters of XQuery transforms must be set in *the Parameters dialog box*. Parameters that are in a namespace must be specified using the qualified name, for example a param parameter in the http://www.oxygenxml.com/ns namespace must be set with the name {http://www.oxygenxml.com/ns}param.

The transformation uses one of the Saxon 9.6.0.7 HE, Saxon 9.6.0.7 PE, Saxon 9.6.0.7 EE processors, a database connection (details can be found in the *Working with Databases* chapter - in the *XQuery transformation* section) or any XQuery processor that provides an XQJ API implementation.

The Saxon 9.6.0.7 EE processor supports also XQuery 3.0 transformations.

XQJ Transformers

This section describes the necessary procedures before running an XQJ transformation.

How to Configure an XQJ Data Source

Any transformer that offers an XQJ API implementation can be used when validating XQuery or transforming XML documents. An example of an XQuery engine that implements the XQJ API is *Zorba*.

 If your XQJ Implementation is native, make sure the directory containing the native libraries of the engine is added to your system environment variables: to PATH - on Windows, to LD_LIBRARY_PATH - on Linux, or to DYLD_LIBRARY_PATH - on OS X. Restart Oxygen XML Developer plugin after configuring the environment variables.

- 2. Open the **Preferences** dialog box and go to **Data Sources**.
- 3. Click the New button in the Data Sources panel.
- **4.** Enter a unique name for the data source.
- 5. Select XQuery API for Java(XQJ) in the Type combo box.
- 6. Press the Add button to add XQJ API-specific files.

You can manage the driver files using the Add, Remove, Detect, and Stop buttons.

Oxygen XML Developer plugin detects any implementation of javax.xml.xquery.XQDataSource and presents it in **Driver class** field.

- 7. Select the most suited driver in the **Driver class** combo box.
- **8.** Click the **OK** button to finish the data source configuration.

How to Configure an XQJ Connection

The steps for configuring an XQJ connection are the following:

- 1. Open the **Preferences** dialog box and go to **Data Sources**.
- 2. Click the **New** button in the **Connections** panel.
- 3. Enter a unique name for this connection.
- **4.** Select one of the previously configured *XQJ data sources* in the **Data Source** combo box.
- **5.** Fill-in the connection details.

The properties presented in the connection details table are automatically detected depending on the selected data source.

6. Click the **OK** button.

Display Result in Sequence View

The result of an XQuery executed on a database can be very large and sometimes only a part of the full result is needed. To avoid the long time necessary for fetching the full result, select the **Present as a sequence** option in the **Output** tab of the **Edit scenario** dialog box. This option fetches only the first chunk of the result. Clicking the **More results available** label that is displayed at the bottom of the **Sequence** view fetches the next chunk of results.

The size of a chunk can be *set with the option Size limit of Sequence view*. The **SEQUETY OPTIONS** button from the **More results available** label provides a quick access to this option by opening *the XQuery panel of the Preferences dialog box* where the option can be modified.

A chunk of the XQuery transformation result is displayed in the **Sequence** view.

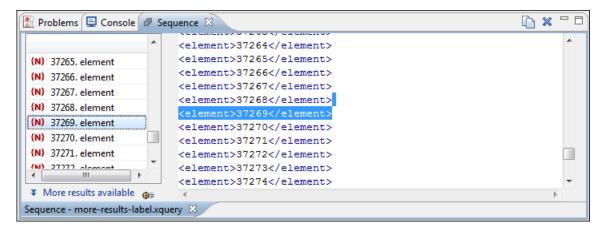

Figure 202: The XQuery transformation result displayed in Sequence view

Advanced Saxon HE/PE/EE XQuery Transformation Options

The XQuery transformation scenario allows you to configure advanced options that are specific for the Saxon HE (Home Edition), PE (Professional Edition), and EE (Enterprise Edition) engines. They are the same options as *the values set in the user preferences* but they are configured as a specific set of transformation options for each transformation scenario.

The advanced options for Saxon 9.6.0.7 Home Edition (HE), Professional Edition (PE), and Enterprise Edition (EE) are as follows:

- **Recoverable errors ("-warnings")** Allows you to choose how dynamic errors are handled. The following options can be selected:
 - recover silently ("silent") Continues processing without reporting the error.
 - recover with warnings ("recover") Issues a warning but continues processing.

- signal the error and do not attempt recovery ("fatal") Issues an error and stops processing.
- Strip whitespaces ("-strip") Can have one of the following values:
 - All ("all") Strips *all* whitespace text nodes from source documents before any further processing, regardless of any xml: space attributes in the source document.
 - **Ignore** (**"ignorable"**) Strips all *ignorable* whitespace text nodes from source documents before any further processing, regardless of any xml: space attributes in the source document. Whitespace text nodes are ignorable if they appear in elements defined in the DTD or schema as having element-only content.
 - None ("none") Strips *no* whitespace before further processing.
- Optimization level ("-opt") This option allows optimization to be suppressed when reducing the compiling time is important, optimization conflicts with debugging, or optimization causes extension functions with side-effects to behave unpredictably.
- Use linked tree model ("-tree:linked") This option activates the linked tree model.
- Enable XQuery 3.0 support ("-qversion:(1.0|3.0)") If checked, Saxon runs the XQuery transformation with the XQuery 3.0 support (this option is enabled by default).
- Initializer class Equivalent to the -init Saxon command-line argument. The value is the name of a user-supplied class that implements the net.sf.saxon.lib.Initializer interface. This initializer is called during the initialization process, and may be used to set any options required on the configuration programmatically. It is particularly useful for tasks such as registering extension functions, collations, or external object models, especially in Saxon-HE where the option cannot be set via a configuration file. Saxon only calls the initializer when running from the command line, but the same code may be invoked to perform initialization when running user application code.

Important: The *advanced Saxon-HE/PE/EE options configured in a transformation scenario* override the Saxon-HE/PE/EE options defined globally.

The following advanced options are specific for Saxon 9.6.0.7 Professional Edition (PE) and Enterprise Edition (EE) only:

- Use a configuration file ("-config") Sets a Saxon 9 configuration file that is used for XQuery transformation and validation
- Allow calls on extension functions ("-ext") If checked, calls on external functions are allowed. Checking this option is recommended in an environment where untrusted stylesheets may be executed. It also disables user-defined extension elements and the writing of multiple output files, both of which carry similar security risks.

The advanced options that are specific for Saxon 9.6.0.7 Enterprise Edition (EE) are as follows:

- Validation of the source file ("-val") Requests schema-based validation of the source file and of any files read using the document () or similar functions. It can have the following values:
 - Schema validation ("strict") This mode requires an XML Schema and enables parsing the source documents with strict schema-validation enabled.
 - Lax schema validation ("lax") If an XML Schema is provided, this mode enables parsing the source documents with schema-validation enabled but the validation will not fail if, for example, element declarations are not found.
 - **Disable schema validation** This specifies that the source documents should be parsed with schema-validation disabled.
- Validation errors in the results tree treated as warnings ("-outval") Normally, if validation of result documents is requested, a validation error is fatal. Enabling this option causes such validation failures to be treated as warnings.
- **Generate bytecode** ("--generateByteCode:(on|off)") If you enable this option, Saxon-EE attempts to generate Java bytecode for evaluation of parts of a query or stylesheet that are amenable to such an action. For further details regarding this option, go to http://www.saxonica.com/documentation9.5/index.html#!javadoc.
- Enable XQuery update ("-update:(on|off)") This option controls whether or not XQuery update syntax is accepted. The default value is off.
- Backup files updated by XQuery ("-backup:(on|off)") If checked, backup versions for any XML files updated with XQuery Update are generated. This option is available when the **Enable XQuery update** option is enabled.

Updating XML Documents using XQuery

Using the bundled Saxon 9.6.0.7 EE XQuery processor Oxygen XML Developer plugin offers support for XQuery Update 1.0. The XQuery Update Facility provides expressions that can be used to make persistent changes to instances of the XQuery 1.0 and XPath 2.0 Data Model. Thus, besides querying XML documents, you can modify them using the various insert/delete/modify/create methods available in the *XQuery Update 1.0* standard.

Choose Saxon 9.6.0.7 EE as a transformer in the scenario associated with the XQuery files containing update statements and Oxygen XML Developer plugin will notify you if the update was successful.

Debugging XSLT Stylesheets and XQuery Documents

Topics:

- XSLT/XQuery Debugging Overview
- Layout
- Working with the XSLT / XQuery Debugger
- Debugging Java Extensions
- Supported Processors for XSLT / XQuery Debugging

This chapter explains the user interface and how to use the debugger with XSLT and XQuery transformations.

XSLT/XQuery Debugging Overview

The XSLT Debugger and XQuery Debugger perspectives enable you to test and debug XSLT 1.0 / 2.0 / 3.0 stylesheets and XQuery 1.0 / 3.0 documents including complex XPath 2.0 / 3.0 expressions. The interface presents simultaneous views of the source XML document, the XSLT/XQuery document and the result document. As you go step by step through the XSLT/XQuery document the corresponding output is generated step by step, and the corresponding position in the XML file is highlighted. At the same time, special views provide various types of debugging information and events useful to understand the transformation process.

The following set of features allow you to test and solve XSLT/XQuery problems:

- Support for XSLT 1.0 stylesheets (using Saxon 6.5.5 and Xalan XSLT engines), XSLT 2.0 / 3.0 stylesheets and XPath 2.0 / 3.0 expressions that are included in the stylesheets (using Saxon 9.6.0.7 XSLT engine) and XQuery 1.0 / 3.0 (using Saxon 9.6.0.7 XQuery engine).
- Stepping capabilities: step in, step over, step out, run, run to cursor, run to end, pause, stop.
- Output to source mapping between every line of output and the instruction element / source context that generated
- Breakpoints on both source and XSLT/XQuery documents.
- Call stack on both source and XSLT/XQuery documents.
- Trace history on both source and XSLT/XQuery documents.
- Support for XPath expression evaluation during debugging.
- Step into imported/included stylesheets as well as included source entities.
- Available templates and hits count.
- Variables view.
- Dynamic output generation.

Layout

The XML and XSL files are displayed in *Text mode*. The *Grid mode* is available only in *the Editor perspective*.

The debugger perspective contains four sections:

- **Source document view (XML)** Displays and allows the editing of XML files (documents).
- XSLT/XQuery document view (XSLT/XQuery) Displays and allows the editing of XSL files(stylesheets) or XQuery documents.
- Output document view Displays the output that results from inputting a document (XML) and a stylesheet (XSL) or XQuery document in the transformer. The transformation result is written dynamically while the transformation is processed.
- Control view The control view is used to configure and control the debugging operations. It also provides a set of *Information views* types. This pane has two sections:
 - Control toolbar
 - Information views

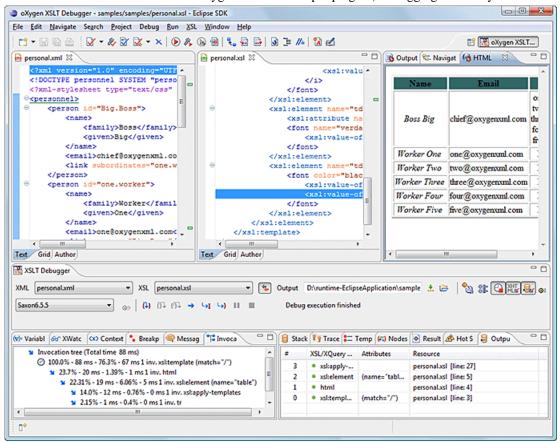

Figure 203: Debugger Mode Interface

XML documents and XSL stylesheets or XQuery documents that were opened in the Editor perspective are automatically sorted into the first two panes. When multiple files of each type are opened, the individual documents and stylesheets are separated using the familiar tab management system of the Editor perspective. Selecting a tab brings the document or stylesheet into focus and enables editing without the need to go back to the Editor perspective.

During debugging, the current execution node is highlighted in both document (XML) and XSLT/XQuery views.

Control Toolbar

The **Control** toolbar contains all the actions that you need to configure and control the debugging process. The following actions are described as they appear in the toolbar from left to right.

Figure 204: Control Toolbar

XML source selector

The current selection represents the source document used as input by the transformation engine. The selection list contains all opened files (XML files being emphasized). This option allows you to use other file types also as source documents. In an XQuery debugging session this selection field can be set to the default value NONE, because usually XQuery documents do not require an input source.

XSL / XQuery selector

The current selection represents the stylesheet or XQuery document to be used by the transformation engine. The selection list contains all opened files (XSLT / XQuery files being emphasized).

When enabled, the XML and XSLT/XQuery selectors display the names of the files opened in the central editor panels. This button is disabled by default.

Output selector

The selection represents the output file specified in the associated transformation scenario.

XSLT / XQuery parameters

XSLT / XQuery parameters to be used by the transformation.

Libraries

Add and remove the Java classes and jars used as XSLT extensions.

Turn on profiling

Enables / Disables current transformation profiling.

Enable XHTML output

Enables the rendering of the output in the XHTML output view during the transformation process. For performance issues, disable XHTML output when working with very large files. Note that only XHTML conformant documents can be rendered by this view. In order to view the output result of other formats, such as HTML, save the **Text output** area to a file and use an external browser for viewing.

When starting a debug session from the editor perspective using the **Debug Scenario** action, the state of this toolbar button reflects the state of the **Show as XHTML** output option from the scenario.

Turn on/off output to source mapping

Enables or disables the output to source mapping between every line of output and the instruction element / source context that generated it.

Debugger preferences

Quick link to Debugger preferences page.

XSLT / XQuery engine selector

Lists the *processors* available for debugging XSLT and XQuery transformations.

SIT / XQuery engine advanced options

Advanced options available for Saxon 9.6.0.7.

Step into <u>F7</u>

Starts the debugging process and runs until the next instruction is encountered.

Step over F8 (Alt F8 on OS X)

Run until the current instruction and its sub-instructions are over. Usually this will advance to the next sibling instruction.

Step out Shift F7 (Meta F8 on OS X)

Run until the parent of the current instruction is over. Usually this will advance to the next sibling of the parent instruction.

→ Run

Starts the debugging process. The execution of the process is paused when a *breakpoint* is encountered or the transformation ends.

□ Run to cursor Ctrl F5

Starts the debugging process and runs until one of the following conditions occur: the line of cursor is reached, a valid breakpoint is reached or the execution ends.

Runs the transformation until the end, without taking into account enabled breakpoints, if any.

Pause Shift F6

Request to pause the current transformation as soon as possible.

Stop F6

Request to stop the current transformation without completing its execution.

Show current execution nodes

Reveals the current debugger context showing both the current instruction and the current node in the XML source. Possible displayed states:

- Entering $(\stackrel{\bullet}{=})$ or leaving $(\stackrel{\bullet}{=})$ an XML execution node.
- Entering ($\stackrel{\bullet}{=}$) or leaving ($\stackrel{\bullet}{=}$) an XSL execution node.
- Entering ($\stackrel{\bullet}{=}$) or leaving ($\stackrel{\bullet}{=}$) an XPath execution node.
 - Note: When you set a MarkLogic server as a processor, the **Show current execution nodes** button is named **Refresh current session context from server**. Click this button to refresh the information in all the views.
- Note: For some of the XSLT processors (Saxon-HE/PE/EE) the debugger could be configured to step into the XPath expressions affecting the behavior of the following debugger actions: **Step into**, **Step over** or **Step Out**.

Debugging Information Views

The information views at the bottom of the editor is comprised of two panes that are used to display various types of information used to understand the transformation process. For each information type there is a corresponding tab. While running a transformation, relevant events are displayed in the various information views. This enables the developer to obtain a clear view of the transformation progress. Using the debug controls developers can easily isolate parts of stylesheet therefore they may be understood and modified. The information types include the following:

Left side information views

- Context node view
- XWatch view
- **Breakpoints** view
- *Messages view* (XSLT only)
- Variables view
- Invocation Tree view

Right side information views

- Stack view
- Output Mapping Stack view
- Trace view
- **Templates** view (XSLT only)
- Nodes/Values Set view
- Hotspots view

Context Node View

The context node is valid only for XSLT debugging sessions and is a source node corresponding to the XSL expression that is evaluated. It is also called the context of execution. The context node implicitly changes as the processor hits various steps (at the point where XPath expressions are evaluated). This node has the same value as evaluating '.' (dot) XPath expression in *XWatch view*. The value of the context node is presented as a tree in the view.

Figure 205: The Context node view

The context node is presented in a tree-like fashion. Nodes from a defined namespace bound to a prefix are displayed using the qualified name. If the namespace is not bound to a prefix, the namespace URI is presented before the node name. The value of the selected attribute or node is displayed in the right side panel. The **Context** view also presents the current mode of the XSLT processor if this mode differs from the default one.

XPath Watch (XWatch) View

The **XWatch** view shows XPath expressions evaluated during the debugging process. Expressions are evaluated dynamically as the processor changes its source context.

When you type an XPath expression in the **Expression** column, Oxygen XML Developer plugin supports you with syntax highlight and *content completion assistance*.

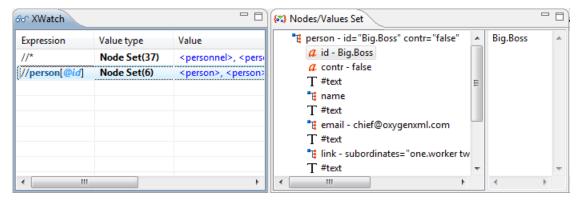

Figure 206: The XPath watch view

Table 4: XWatch columns

Column	Description
Expression	XPath expression to be evaluated (XPath 1.0 or $2.0 / 3.0$ compliant).
Value	Result of XPath expression evaluation. Value has a type (see <i>the possible values</i> in the section <i>Variables View</i> on page 440). For <i>Node Set</i> results, the number of nodes in the set is shown in parenthesis.

- ①
- **Important:** Remarks about working with the **XWatch** view:
- Expressions that reference variable names are not evaluated.
- The expression list is not deleted at the end of the transformation (it is preserved between debugging sessions).
- To insert a new expression, click the first empty line of the **Expression** column and start typing.

- To delete an expression, click its **Expression** column and delete its content.
- If the expression result type is a *Node Set*, click it (**Value** column) and its value is displayed in the *Nodes/Values Set view*.

Breakpoints View

This view lists all breakpoints that are set on opened documents. Once you *insert a breakpoint* it is automatically added in this list. Breakpoints can be set in XSLT/XQuery documents and XML documents in XSLT/XQuery debugging sessions. A breakpoint can have an associated break condition that represents an XPath expression evaluated in the current debugger context. In order to be processed, their evaluation result should be a boolean value. A breakpoint with an associated condition only stops the execution of the Debugger if the breakpoint condition is evaluated as **true**.

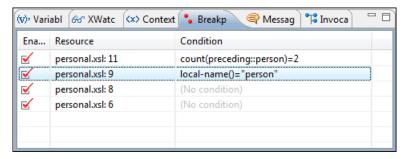

Figure 207: The Breakpoints View

The **Breakpoints** view contains the following columns:

- Enabled If checked, the current condition is evaluated and taken into account.
- Resource Resource file and number of the line where the breakpoint is set.
- Condition XSLT/XQuery expression to be evaluated during debugging. The expression will be evaluated at every debug step.

Clicking a record highlights the breakpoint line in the document.

Note: The breakpoints list is not deleted at the end of a transformation (it is preserved between debugging sessions).

The following actions are available in the contextual menu of the table:

Go to

Moves the cursor to the source of the breakpoint.

Enable

Enables the breakpoint.

Disable

Disables the breakpoint. A disabled breakpoint will not be evaluated by the Debugger.

Add

Allows you to add a new breakpoint and breakpoint condition.

Edit

Allows you to edit an existing breakpoint.

Remove

Deletes the selected breakpoint.

Enable all

Enables all breakpoints.

Disable all

Disables all breakpoints.

Removes all breakpoints.

Messages View

xsl:message instructions are one way to signal special situations encountered during transformation as well as a raw way of doing the debugging. This view is available only for XSLT debugging sessions and shows all xsl:message calls executed by the XSLT processor during transformation.

Message	Terminate	Resource
Message 1	no	personal.xsl [line: 8]
Message 2	no	personal.xsl [line: 12]
Message 3	no	personal.xsl [line: 29]

Figure 208: The Messages View

Table 5: Messages columns

Column	Description
Message	Message content.
Terminate	Signals if processor terminates the transformation or not once it encounters the message (yes/no respectively).
Resource	Resource file where xsl:message instruction is defined and the message line number.

The following actions are available in the contextual menu:

Go to

Highlight the XSL fragment that generated the message.

Copy

Copies to clipboard message details (system ID, severity info, description, start location, terminate state).

- Clicking a record from the table highlights the xsl:message declaration line.
- Message table values can be sorted by clicking the corresponding column header. Clicking the column header switches the sorting order between: ascending, descending, no sort.

Stack View

This view shows the current execution stack of both source and XSLT/XQuery nodes. During transformation two stacks are managed: one of source nodes being processed and the other for XSLT/XQuery nodes being processed. Oxygen XML Developer plugin shows both node types into one common stack. The source (XML) nodes are preceded by a red color icon while XSLT/XQuery nodes are preceded by a green color icon. The advantage of this approach is that you can always see the source scope on which a XSLT/XQuery instruction is executed (the last red color node on the stack). The stack is oriented upside down.

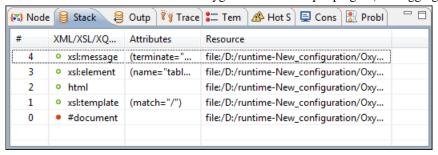

Figure 209: The Stack View

The contextual menu contains one action: **Go to**, which moves the selection in the editor panel to the line containing the XSLT element that is displayed on the selected line from the view.

Table 6: Stack columns

Column	Description
#	Order number, represents the depth of the node (0 is the stack base).
XML/XSLT/XQuery Node	Node from source or stylesheet document currently being processed. One particular stack node is the document root, noted as #document .
Attributes	Attributes of the node (a list of id="value" pairs).
Resource	Resource file where the node is located.

Important: Remarks:

- Clicking a record from the stack highlights that node's location inside resource.
- Using Saxon, the stylesheet elements are qualified with XSL proxy, while using Xalan you only see their names. (example: xsl:template using Saxon and template using Xalan).
- Only the Saxon processor shows element attributes.
- · The Xalan processor shows also the built-in rules.

Output Mapping Stack View

The **Output Mapping Stack** view displays *context data* and presents the XSLT templates/XQuery elements that generated specific areas of the output.

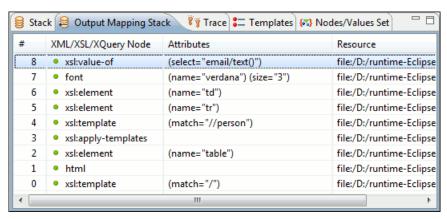

Figure 210: The Output Mapping Stack view

The **Go to** action of the contextual menu takes you in the editor panel at the line containing the XSLT element displayed in the **Output Mapping Stack** view.

Table 7: Output Mapping Stack columns

Column	Description
#	The order number in the stack of XSLT templates/XQuery elements. Number 0 corresponds to the bottom of the stack in the status of the XSLT/XQuery processor. The highest number corresponds to the top of the stack.
XSL/XQuery Node	The name of an XSLT template/XQuery element that participated in the generation of the selected output area.
Attributes	The attributes of the XSLT template/XQuery node.
Resource	The name of the file containing the XSLT template/XQuery element.

1

Important: Remarks:

- Clicking a record highlights that XSLT template definition/XQuery element inside the resource (XSLT stylesheet file/XQuery file).
- Saxon only shows the applied XSLT templates having at least one hit from the processor. Xalan shows all defined XSLT templates, with or without hits.
- The table can be sorted by clicking the corresponding column header. When clicking a column header the sorting order switches between: ascending, descending, no sort.
- · Xalan shows also the built-in XSLT rules.

Trace History View

Usually the XSLT/XQuery processors signal the following events during transformation:

- → Entering a source (XML) node.
- - Leaving a source (XML) node.
- → Entering a XSLT/XQuery node.
- Leaving a XSLT/XQuery node.

The trace history catches all these events, so you can see how the process evolved. The red icon lines denote source nodes while the green icon lines denote XSLT/XQuery nodes.

It is possible to save the element trace in a structured XML document. The action is available on the contextual menu of the view. In this way you have the possibility to compare the trace results from different debug sessions.

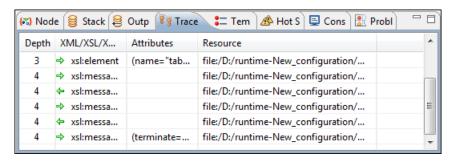

Figure 211: The Trace History View

The contextual menu contains the following actions:

ro to

Moves the selection in the editor panel to the line containing the XSLT element or XML element that is displayed on the selected line from the view;

Export to XML

Saves the entire trace list into XML format.

Table 8: Trace History columns

Column	Description
Depth	Shows you how deep the node is nested in the XML or stylesheet structure. The bigger the number, the more nested the node is. A depth 0 node is the document root.
XML/XSLT/XQuery Node	Represents the node from the processed source or stylesheet document. One particular node is the document root, noted as #document. Every node is preceded by an arrow that represents what action was performed on it (entering or leaving the node).
Attributes	Attributes of the node (a list of id="value" pairs).
Resource	Resource file where the node is located.

1

Important: Remarks:

- Clicking a record highlights that node's location inside the resource.
- Only the Saxon processor shows the element attributes.
- The Xalan processor shows also the built-in rules.

Templates View

The xsl:template is the basic element for stylesheets transformation. This view is only available during XSLT debugging sessions and shows all xsl:template instructions used by the transformation. Being able to see the number of *hits* for each of the templates allows you to get an idea of the stylesheet coverage by template rules with respect to the input source.

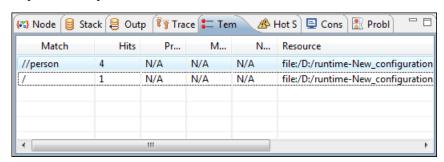

Figure 212: The Templates view

The contextual menu contains one action: **Go to**, which moves the selection in the editor panel to the line containing the XSLT template that is displayed on the selected line from the view.

Table 9: Templates columns

Column	Description
Match	The match attribute of the xsl:template.

Column	Description
Hits	The number of hits for the xsl:template. Shows how many times the XSLT processor used this particular template.
Priority	The template priority as established by XSLT processor.
Mode	The mode attribute of the xsl:template.
Name	The name attribute of the xsl:template.
Resource	The resource file where the template is located.

Important: Remarks:

- Clicking a record highlights that template definition inside the resource.
- Saxon only shows the applied templates having at least one hit from the processor. Xalan shows all defined templates, with or without hits.
- Template table values can be sorted by clicking the corresponding column header. When clicking a column header the sorting order switches between: ascending, descending, no sort.
- Xalan shows also the built-in rules.

Nodes/Values Set View

This view is always used in relation with *The Variables view* and *the XWatch view*l. It shows an XSLT node set value in a tree form. The node set view is updated as response to the following events:

- You click a variable having a node set value in one of the above 2 views.
- You click a tree fragment in one of the above 2 views.
- You click an XPath expression evaluated to a node set in one of the above 2 views.

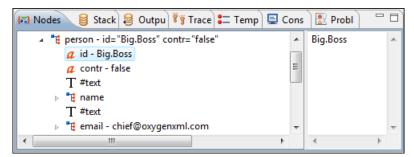

Figure 213: The Node Set view

The nodes / values set is presented in a tree-like fashion. Nodes from a defined namespace bound to a prefix are displayed using the qualified name. If the namespace is not bound to a prefix the namespace URI is presented before the node name. The value of the selected attribute or node is displayed in the right side panel.

Important: Remarks:

- For longer values in the right side panel, the interface displays it with an ellipsis (...) at the end. A more detailed value is available as a tooltip when hovering over it.
- Clicking a record highlights the location of that node in the source or stylesheet view.

Variables View

Variables and parameters play an important role during an XSLT/XQuery transformation. Oxygen XML Developer plugin uses the following icons to differentiate variables and parameters:

- Global variable.
- **{V}** Local variable.

- P Global parameter.
- {P} Local parameter.

The following value types are available:

- Boolean
- String
- **Date** XSLT 2.0 / 3.0 only.
- Number
- Set
- Object
- Fragment Tree fragment.
- Anv
- Undefined The value was not yet set, or it is not accessible.

E,

Note:

When Saxon 6.5 is used, if the value is unavailable, then the following message is displayed in the **Value** field: "The variable value is unavailable".

When Saxon 9 is used:

- If the variable is not used, the **Value** field displays "The variable is declared but never used".
- If the variable value cannot be evaluated, the Value field displays "The variable value is unavailable".
- Document
- Element
- Attribute
- ProcessingInstruction
- Comment
- Text
- Namespace
- Evaluating Value under evaluation.
- Not Known Unknown types.

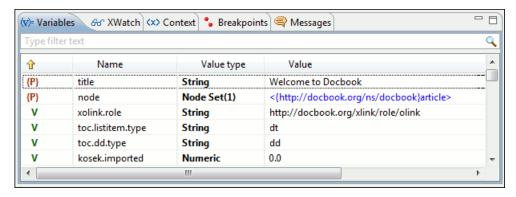

Figure 214: The Variables View

Table 10: Variables columns

Column	Description	
Name	Name of variable / parameter.	
Value type	Type of variable/parameter.	
Value	Current value of variable / parameter.	

The value of a variable (the **Value** column) can be copied to the clipboard for pasting it to other editor area with the action **Copy value** from the contextual menu of the table from the view. This is useful in case of long and complex values which are not easy to remember by looking at them once.

Important: Remarks:

- Local variables and parameters are the first entries presented in the table.
- Clicking a record highlights the variable definition line.
- · Variable values could differ depending on the transformation engine used or stylesheet version set.
- If the value of the variable is a node set or a tree fragment, clicking it causes the *Node Set view* to be shown with the corresponding set of values.
- Variable table values can be sorted by clicking the corresponding column header. Clicking the column header switches between the orders: ascending, descending, no sort.

Multiple Output Documents in XSLT 2.0 and XSLT 3.0

For XSLT 2.0 and XSLT 3.0 stylesheets that store the output in more than one file by using the xsl:result-document instruction the content of the file created in this way is displayed dynamically while the transformation is running in an output view. There is one view for each xsl:result-document instruction so that the output of different instructions is not mixed but is presented in different views.

Working with the XSLT / XQuery Debugger

This section describes how to work with the debugger in the most common use cases.

To watch our video demonstration about how you can use the **XSLT Debugger**, go to http://oxygenxml.com/demo/XSLT_Debugger.html.

Steps in a Typical Debug Process

To debug a stylesheet or XQuery document follow the procedure:

- 1. Open the source XML document and the XSLT/XQuery document.
- 2. If you are in the Oxygen XML Developer plugin XML perspective switch to the Oxygen XML Developer plugin XSLT Debugger perspective or the Oxygen XML Developer plugin XQuery Debugger perspective with one of the actions (here explained for XSLT):
 - Menu Window > Open Perspective > Other > Oxygen XSLT Debugger
 - The toolbar button Debug scenario This action initializes the Debugger perspective with the parameters of the transformation scenario. Any modification applied to the scenario parameters (the transformer engine, the XSLT parameters, the transformer extensions, etc.) will be saved back in the scenario when exiting from the Debugger perspective.
- **3.** Select the source XML document in the XML source selector of *the Control toolbar*. In the case of XQuery debugging, if your XQuery document has no implicit source, set the source selector value to **NONE**.
- **4.** Select the XSLT/XQuery document in the XSLT/XQuery selector of *the Control toolbar*.
- **5.** Set XSLT/XQuery parameters from the button available on *the Control toolbar*.
- **6.** Set one or more breakpoints.
- 7. Step through the stylesheet using the buttons available on *the Control toolbar*:
 - Step into
 - O Step over

 - → Run
 - H Run to cursor

- 🕶 🧡 Run to end
- II Pause
- 📕 Stop
- **8.** Examine the information in the Information views to find the bug in the transformation process. You may find *the procedure for determining the XSLT template/XQuery element that generated an output section* useful for fixing bugs in the transformation.

Using Breakpoints

The Oxygen XML Developer plugin XSLT/XQuery Debugger allows you to interrupt XSLT/XQuery processing to gather information about variables and processor execution at particular points. To ensure breakpoints are persistent between work sessions, they are saved at project level. You can set a maximum of 100 breakpoints per project.

Inserting Breakpoints

To insert a breakpoint, follow these steps:

- Click the line where you want to insert the breakpoint in the XML source document or the XSLT/XQuery document.
 You can only set breakpoints on the XML source in XSLT or XQuery debugging sessions.
 Breakpoints are automatically created on the ending line of a start tag, even if you click a different line.
- 2. Right-click the vertical stripe on the left side of the editor panel and select Add breakpoint.

Removing Breakpoints

Only one action is required to remove a breakpoint:

Right-click the breakpoint icon in the vertical stripe on the left side of the editor panel and select **Remove breakpoint**.

Determining What XSLT / XQuery Expression Generated Particular Output

In order to quickly spot the XSLT templates or XQuery expressions with problems it is important to know what XSLT template in the XSLT stylesheet or XQuery expression in the XQuery document and what element in the source XML document generated a specified area in the output.

Some of the debugging capabilities, for example *Step in* can be used for this purpose. Using *Step in* you can see how output is generated and link it with the XSLT/XQuery element being executed in the current source context. However, this can become difficult on complex XSLT stylesheets or XQuery documents that generate a large output.

You can click the text from the **Text** output view or **XHTML** output view and the editor will select the XML source context and the XSLT template/XQuery element that generated the text. Also inspecting the whole stack of XSLT templates/XQuery elements that determined the state of the XSLT/XQuery processor at the moment of generating the specified output area speeds up the debugging process.

- 1. Switch to the Oxygen XML Developer plugin XSLT Debugger perspective or Oxygen XML Developer plugin XQuery Debugger perspective with one of the actions (here explained for XSLT):
 - Go to Window > Open Perspective > Other > Oxygen XSLT Debugger
 - Go to . The toolbar button **Debug scenario** . This action initializes the Debugger perspective with the parameters of the transformation scenario. Any modification applied to the scenario parameters (the transformer

- engine, XSLT parameters, transformer extensions, etc.) will be saved back in the scenario when exiting from the Debugger perspective.
- 2. Select the source XML document in the XML source selector of the Control toolbar. In the case of XQuery debugging without an implicit source choose the NONE value.
- 3. Select the XSLT / XQuery document in the XSLT / XQuery selector of the Control toolbar.
- **4.** Select the XSLT / XQuery engine in the XSLT / XQuery engine selector of *the Control toolbar*.
- **5.** Set XSLT / XQuery parameters from the button available on *the Control toolbar*.
- **6.** Apply the XSLT stylesheet or XQuery transformation using the \rightarrow **Run to end** button that is available on *the Control* toolbar.
- 7. Inspect the mapping by clicking a section of the output from the **Output** view of the Oxygen XML Developer plugin XSLT Debugger or Oxygen XML Developer plugin XQuery Debugger perspectives.

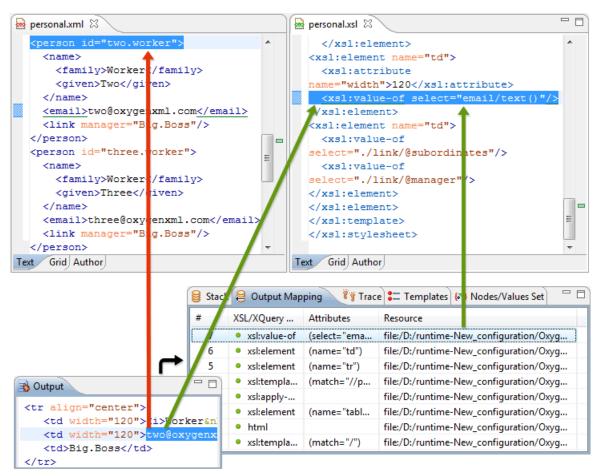

Figure 215: Text Output to Source Mapping

This action will highlight the XSLT / XQuery element and the XML source context. This XSLT template/XQuery element that is highlighted in the XSLT/XQuery editor represents only the top of the stack of XSLT templates/XQuery elements that determined the state of the XSLT/XQuery processor at the moment of generating the clicked output section. In the case of complex transformations inspecting the whole stack of XSLT templates/XQuery elements speeds up the debugging process. This stack is available in the Output Mapping Stack view.

Debugging Java Extensions

The XSLT/XQuery debugger does not step into Java classes that are configured as XSLT/XQuery extensions of the transformation. To step into Java classes, inspect variable values and set breakpoints in Java methods, set up a Java debug configuration in an IDE like the Eclipse SDK as described in the following steps:

- 1. Create a debug configuration.
 - a) Set at least 256 MB as heap memory for the Java virtual machine (recommended 512 MB) by setting the -Xmx parameter in the debug configuration, for example "-Xmx512m".
 - b) Make sure the [OXYGEN_DIR]/lib/oxygen.jar file and your Java extension classes are on the Java classpath.
 - The Java extension classes should be the same classes that were *set as an extension* of the XSLT/XQuery transformation in the debugging perspective.
 - c) Set the class ro.sync.exml.Oxygen as the main Java class of the configuration. The main Java class ro.sync.exml.Oxygen is located in the oxygen.jar file.
- 2. Start the debug configuration.

Now you can set breakpoints and inspect Java variables as in any Java debugging process executed in the selected IDE (Eclipse SDK, and so on.).

Supported Processors for XSLT / XQuery Debugging

The following built-in XSLT processors are integrated in the debugger and can be selected in the *Control Toolbar*:

- Saxon 9.6.0.7 HE (Home Edition) a limited version of the Saxon 9 processor, capable of running XSLT 1.0, XSLT 2.0 / 3.0 basic and XQuery 1.0 transformations, available in both the XSLT debugger and the XQuery one,
- Saxon 9.6.0.7 PE (Professional Edition) capable of running XSLT 1.0 transformations, XSLT 2.0 basic ones and XQuery 1.0 ones, available in both the XSLT debugger and the XQuery one,
- Saxon 9.6.0.7 EE (Enterprise Edition) a schema aware processor, capable of running XSLT 1.0 transformations, XSLT 2.0/3.0 basic ones, XSLT 2.0/3.0 schema aware ones and XQuery 1.0/3.0 ones, available in both the XSLT debugger and the XQuery debugger,
- Saxon 6.5.5 capable of running only XSLT 1.0 transformations, available only in the XSLT debugger,
- Xalan 2.7.1 capable of running only XSLT 1.0 transformations, available only in the XSLT debugger.

Performance Profiling of XSLT Stylesheets and XQuery Documents

Topics:

- XSLT/XQuery Performance Profiling Overview
- Viewing Profiling Information
- Working with XSLT/XQuery Profiler

This chapter explains the user interface and how to use the profiler for finding performance problems in XSLT transformations and XQuery ones.

Whether you are trying to identify a performance issue that is causing your production XSLT/XQuery transformation to not meet customer expectations or you are trying to proactively identify issues prior to deploying your XSLT/XQuery transformation, using the XSLT/XQuery profiler feature is essential to helping you save time and ultimately ensure a better performing, more scalable XSLT/XQuery transformation.

The XSLT/XQuery profiling feature can use any available XSLT/XQuery processors that could be used for debugging and it is available from the debugging perspective.

Enabling and disabling the profiler is controlled by the **Profiler button* from the debugger control toolbar. The XSLT/XQuery profiler is off by default. This option is not available during a debugger session so you should set it before starting the transformation.

Viewing Profiling Information

This section explains the views that display the profiling data collected by the profiles during the transformation.

Invocation Tree View

The **Invocation Tree** view shows a top-down call tree that represents how XSLT instructions or XQuery expressions are processed.

Figure 216: Invocation Tree View

The entries in the invocation tree include a few possible icons that indicate the following:

- Points to a call whose inherent time is insignificant compared to its total time.
- Oints to a call whose inherent time is significant compared to its total time (greater than 1/3rd of its total time).

Every entry in the invocation tree includes textual information that depends on the XSLT/XQuery profiler settings:

- A percentage number of the total time that is calculated with respect to either the root of the tree or the calling instruction.
- A total time measurement in milliseconds or microseconds. This is the total execution time that includes calls into other instructions.
- A percentage number of the inherent time that is calculated with respect to either the root of the tree or the calling instruction.
- An inherent time measurement in milliseconds or microseconds. This is the inherent execution time of the instruction.
- An invocation count that shows how often the instruction has been invoked on this call-path.
- An instruction name that contains also the attributes description.

Hotspots View

The **Hotspots** view displays a list of all instruction calls that lie above the threshold defined in the *XSLT/XQuery profiler* settings.

Figure 217: Hotspots View

By opening a hotspot instruction entry, the tree of back-traces leading to that instruction call are calculated and shown.

Every hotspot is described by the values from the following columns:

- **Instruction** The name of the instruction.
- **Percentage** The percentage number for this hotspot entry with respect to the total time.
- **Time** The inherent time in milliseconds or microseconds of how much time has been spent in the hotspot. All calls into this instruction are summed up regardless of the particular call sequence.
- Calls The invocation count of the hotspot entry.

If you click the A handle on the left side of a hotspot, a tree of back-traces will be shown.

Every entry in the backtrace tree has textual information attached to it that depends on the *XSLT/XQuery profiler settings*:

- A percentage number that is calculated with respect to either the total time or the called instruction.
- A time measured in milliseconds or microseconds of how much time has been contributed to the parent hotspot on this call-path.
- An invocation count that shows how often the hotspot has been invoked on this call-path.
 - **Note:** This is not the number of invocations of this instruction.
- An instruction name that also contains its attributes.

Working with XSLT/XQuery Profiler

Profiling activity is linked with debugging activity, so the first step in order to profile is to switch to debugging perspective and follow the corresponding procedure for debugging (see *Working with XSLT Debugger*).

Immediately after turning the profiler on two new information views are added to the current debugger *information* views:

- Invocation tree view on left side
- Hotspots view on right side

Profiling data is available only after the transformation ends successfully.

Looking to the right side (*Hotspots view*), you can immediately spot the time the processor spent in each instruction. As an instruction usually calls other instructions the used time of the called instruction is extracted from the duration time of the caller (the hotspot only presents the inherent time of the instruction).

Looking to the left side (*Invocation tree view*), you can examine how style instructions are processed. This result view is also named call-tree, as it represents the order of style processing. The profiling result shows the duration time for each of the style-instruction including the time needed for its called children.

Figure 218: Source backmapping

In any of the above views you can use the backmapping feature in order to find the XSLT stylesheet or XQuery expression definition. Clicking the selected item cause Oxygen XML Developer plugin to highlight the XSLT stylesheet or XQuery expression source line where the instruction is defined.

When navigating through the trees by opening instruction calls, Oxygen XML Developer plugin automatically expands instructions which are only called by one other instruction themselves.

The profiling data can be saved into XML and HTML format. On any of the above views, use the contextual menu and select the corresponding choice. Basically saving HTML means saving XML and applying an XSLT stylesheet to render the report as XML. These stylesheets are included in the Oxygen XML Developer plugin distribution (see the subfolder <code>[OXYGEN_DIR]/frameworks/profiler/)</code> so you can make your own report based on the profiling raw data.

If you want to change the XSLT/XQuery profiler settings, use the contextual menu and choose the corresponding View settings entry.

Caution: Profiling exhaustive transformation may run into an OutOfMemory error due to the large amount of information being collected. If this is the case you can close unused projects when running the profiling or use high values for Java VM options –Xms and –Xmx. If this does not help you can shorten your source XML file and try again.

Working with Archives

Topics:

- Browsing and Modifying Archives
- Working with EPUB
- Editing Files From Archives

Oxygen XML Developer plugin offers the means to manipulate files directly from ZIP type archives. By manipulation one should understand opening and saving files directly in archives, browsing and modifying archive structures. The archive support is available for all ZIP-type archives, which includes:

- ZIP archives
- · EPUB books
- · JAR archives
- Office Open XML (OOXML) files
- Open Document Format (ODF) files
- IDML files

This means that you can modify, transform, validate files directly from OOXML or ODF packages. The structure and content of an EPUB book, OOXML file or ODF file *can be opened*, *edited and saved* as for any other ZIP archive.

You can transform, validate and perform many other operations on files directly from an archive. When selecting an URL for a specific operation like transformation or validation you can click the **Browse for archived file** button to navigate and choose the file from a certain archive.

Browsing and Modifying Archives

You can navigate archives either by opening them from the **Navigator** or by using the integration with the Eclipse File System. For the EFS (Eclipse File System) integration you must right click the archive in the **Navigator** and choose **Expand Zip Archive**. All the standard Eclipse **Navigator** actions are available on the mounted archive. If you decide to close the archive you can use the **Collapse ZIP Archive** action located in the contextual menu for the expanded archive. Any file opened from the archive expanded in the EFS will be closed when the archive in unmounted.

If you open an archive as an Eclipse editor, the archive will be unmounted when the editor is closed.

[] **Important:** If a file is not recognized by Oxygen XML Developer plugin as a supported archive type, you can add it from the *Archive preferences page*.

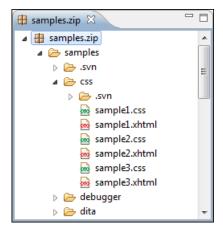

Figure 219: Browsing an Archive

Working with EPUB

EPUB is a free and open electronic book standard by the International Digital Publishing Forum (IDPF). It was designed for *reflowable content*, meaning that the text display can be optimized for the particular display device used by the reader of the EPUB-formatted book. Oxygen XML Developer plugin supports both EPUB 2.0 and EPUB 3.0.

Opening an EPUB file exposes all its internal components:

- Document content (XHTML and image files).
- Packaging files.
- Container files.

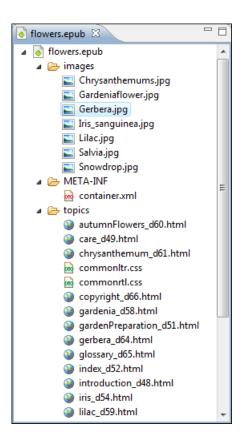

Figure 220: EPUB file displayed in Eclipse

Here you can edit, delete and add files that compose the EPUB structure. To check that the EPUB file you are editing is valid, invoke the Validate and Check for Completeness action. Oxygen XML Developer plugin uses the open-source EpubCheck validator to perform the validation. This validator detects many types of errors, including OCF container structure, OPF and OPS mark-up, as well as internal reference consistency. All errors found during validation are displayed in a separate tab in the Errors view.

- Note: Invoke the Open in System Application action to see how the EPUB is rendered in your system default EPUB reader application.
- Note: All changes made to the structure of an EPUB, or to the contents of the files inside an EPUB are immediately saved.

To watch our video demonstration about the EPUB support in Oxygen XML Developer plugin, go to http://oxygenxml.com/demo/Epub.html.

Create an EPUB

To begin writing an EPUB file from scratch, do the following:

- 1. Go to File > New, press Ctrl N (Meta N on OS X) on your keyboard. or click New on the main toolbar.
- 2. Choose **EPUB Book** template. Click **Create**. Choose the name and location of the file. Click **Save**. A skeleton EPUB file is saved on disk and open in the **Archive Browser** view.
- 3. Use the Archive Browser view specific actions to edit, add and remove resources from the archive.
- 4. Use the **Validate and Check for Completeness** action to verify the integrity of the EPUB archive.

Publish to EPUB

Oxygen XML Developer plugin comes with built-in support for publishing DocBook and DITA XML documents directly to EPUB.

- 1. Open the **Configure Transformation Scenario(s)** dialog box and select a predefined transformation scenario. To publish from DITA, select the **DITA Map EPUB** transformation scenario. To publish from DocBook select the **DocBook EPUB** transformation scenario.
- 2. Click **Apply associated** to run the transformation scenario.

Editing Files From Archives

You can open and edit files directly from an archive using the **Archive Browser** view. When saving the file back to archive, you are prompted to choose if you want the application to make a backup copy of the archive before saving the new content. If you choose **Never ask me again**, you will not be asked again to make backup copies. You can re-enable the pop-up message from the *Archive preferences page*.

Note: All changes made to the structure of an archive, or to the contents of the files inside an archive are immediately saved.

Working with Databases

Topics:

- Relational Database Support
- Native XML Database (NXD) Support
- XQuery and Databases
- WebDAV Connection
- BaseX Support

XML is a storage and interchange format for structured data and is supported by all major database systems. Oxygen XML Developer plugin offers the means for managing the interaction with some of the most commonly used databases (both relational and Native XML Databases). Through this interaction, Oxygen XML Developer plugin helps users to understand browsing, querying, SQL execution support, content editing, importing from databases, and generating XML Schema from database structure.

Relational databases use a relational model and are based on tables linked by a common key. Oxygen XML Developer plugin offers support for the following relational databases: IBM DB2, MySQL, Microsoft SQL Server, and Oracle 11g.

The following actions are allowed:

- Browsing the tables of these types of databases in the Data Source Explorer view
- Executing SQL queries against them
- Calling stored procedures with input and output parameters

Oxygen XML Developer plugin offers generic support (table browsing and execution of SQL queries) for any JDBC-compliant database (for example, *MariaDB*).

To watch our video demonstration about the integration between the relational databases and Oxygen XML Developer plugin, go to http://www.oxygenxml.com/demo/Author_Database_Integration.html.

Configuring Relational Database Data Sources

This section describes the procedures for configuring the data sources for relational databases:

- IBM DB2
- Microsoft SQL Server
- Generic JDBC
- MySQL
- Oracle 11g
- PostgreSQL 8.3

Configuring Database Connections

This section describes the procedures for configuring the connections for relational databases:

- *IBM DB2*
- Microsoft SQL Server
- JDBC-ODBC
- MySQL
- Generic ODBC
- Oracle 11g
- PostgreSQL 8.3

How to Configure Support For Relational Databases

This section contains procedures about configuring the support for various relational databases.

How to Configure IBM DB2 Support

To configure the support for the IBM DB2 database follow this procedure:

- 1. Go to the IBM website and in the DB2 Clients and Development Tools category select the DB2 Driver for JDBC and SQLJ download link. Fill out the download form and download the zip file. Unzip the zip file and use the db2jcc.jar and db2jcc_license_cu.jar files in Oxygen XML Developer plugin for configuring a DB2 data source.
- 2. Configure a IBM DB2 Data Source driver.
- 3. Configure a IBM DB2 Server Connection.
- **4.** Use the **Data Source Explorer** view from the **Window** > **Show View** > **Data Source Explorer** menu or switch to the **Database Perspective** (available from **Window** > **Open Perspective** > **Database**).

How to Configure an IBM DB2 Data Source

Available in the Enterprise edition only.

The steps for configuring a data source for connecting to an IBM DB2 server are as follows:

- 1. Open the Preferences dialog box and go to Data Sources.
- 2. Click the **\(\psi\)** New button in the **Data Sources** panel.

The dialog box for configuring a data source is opened.

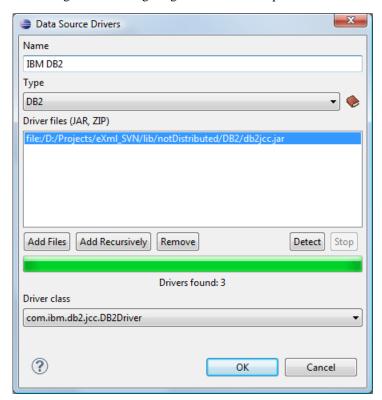

Figure 221: Data Source Drivers Configuration Dialog Box

- **3.** Enter a unique name for the data source.
- **4.** Select *DB2* in the driver **Type** drop-down menu.
- **5.** Add the driver files for IBM DB2 using the **Add Files** button.

The IBM DB2 driver files are:

- db2jcc.jar
- db2jcc_license_cisuz.jar
- db2jcc_license_cu.jar

The **Driver files** section lists *download links for database drivers* that are necessary for accessing IBM DB2 databases in Oxygen XML Developer plugin.

- **6.** Select the most appropriate **Driver class**.
- 7. Click the **OK** button to finish the data source configuration.

To watch our video demonstration about running XQuery against an IBM DB2 Pure XML database, go to http://www.oxygenxml.com/demo/DB2.html.

How to Configure an IBM DB2 Connection

The support to create an IBM DB2 connection is available in the Enterprise edition only.

To configure a connection to an IBM DB2 server, follow these steps:

- 1. Open the Preferences dialog box and go to Data Sources.
- 2. In the Connections panel, click the **New** button.

The dialog box for configuring a database connection is displayed.

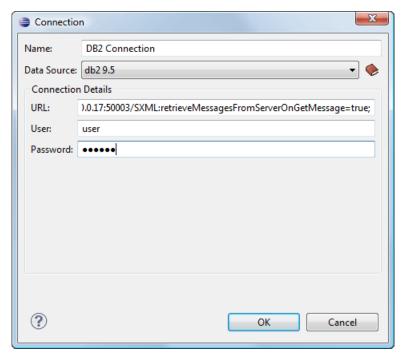

Figure 222: The Connection Configuration Dialog Box

- **3.** Enter a unique name for the connection.
- 4. Select an *IBM DB2* data source in the **Data Source** drop-down menu.
- 5. Enter the connection details.
 - a) Enter the URL to the installed IBM DB2 engine.
 - b) Enter the user name to access the IBM DB2 engine.
 - c) Enter the password to access the IBM DB2 engine.
- **6.** Click the **OK** button to finish the configuration of the database connection.

To watch our video demonstration about running XQuery against an IBM DB2 Pure XML database, go to http://www.oxygenxml.com/demo/DB2.html.

How to Configure Microsoft SQL Server Support

To configure the support for Microsoft SQL Server database follow this procedure:

- 1. Download the appropriate MS SQL JDBC driver from the Microsoft website. For SQL Server 2008 R2 and older go to http://www.microsoft.com/en-us/download/details.aspx?id=21599. For SQL Server 2012 and 2014 go to http://www.microsoft.com/en-us/download/details.aspx?id=11774.
- 2. Configure a MS SQL Server Data Source driver.
- 3. Configure a MS SQL Server Connection.
- **4.** Use the **Data Source Explorer** view from the **Window** > **Show View** > **Data Source Explorer** menu or switch to the **Database Perspective** (available from **Window** > **Open Perspective** > **Database**).

How to Configure a Microsoft SQL Server Data Source

Available in the Enterprise edition only.

The steps for configuring a data source for connecting to a Microsoft SQL server are as follows:

- 1. Open the Preferences dialog box and go to Data Sources.
- 2. Click the ***** New button in the **Data Sources** panel.

The dialog box for configuring a data source is opened.

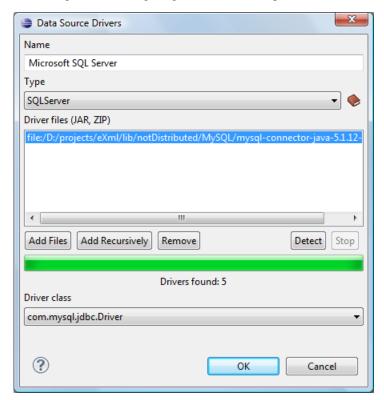

Figure 223: Data Source Drivers Configuration Dialog Box

- **3.** Enter a unique name for the data source.
- **4.** Select *SQLServer* in the driver **Type** drop-down menu.
- 5. Add the Microsoft SQL Server driver file using the Add Files button.
 The SQL Server driver file is called sqljdbc. jar. In the The Driver files section lists download links for database drivers that are necessary for accessing Microsoft SQL Server databases in Oxygen XML Developer plugin.
- **6.** Select the most appropriate **Driver class**.
- 7. Click the **OK** button to finish the data source configuration.

How to Configure a Microsoft SQL Server Connection

The support to configure a Microsoft SQL Server connection is available in the Enterprise edition only.

To configure a connection to a Microsoft SQL Server, follow these steps:

- 1. Open the Preferences dialog box and go to Data Sources.
- 2. In the Connections panel, click the * New button.

The dialog box for configuring a database connection is displayed.

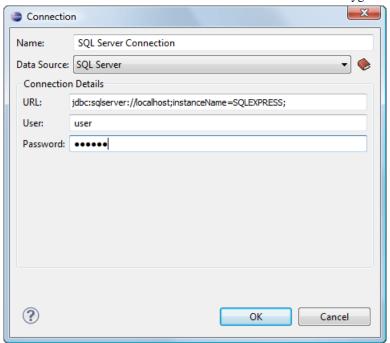

Figure 224: The Connection Configuration Dialog Box

- **3.** Enter a unique name for the connection.
- **4.** Select the *SQL Server* data source in the **Data Source** drop-down menu.
- **5.** Enter the connection details.
 - a) Enter the URL of the SQL Server server.

If you want to connect to the server using Windows integrated authentication, you must add ; integratedSecurity=true to the end of the URL. The URL will look like this:

jdbc:sqlserver://localhost;instanceName=SQLEXPRESS;integratedSecurity=true;

Note: For integrated authentication, leave the **User** and **Password** fields empty.

- b) Enter the user name for the connection to the SQL Server.
- c) Enter the password for the connection to the SQL Server.
- **6.** Click the **OK** button to finish the configuration of the database connection.

How to Configure Generic JDBC Support

To configure the support for a generic JDBC database follow this procedure:

- 1. Configure a Generic JDBC Data Source driver.
- 2. Configure a Generic JDBC Connection.
- 3. Use the **Data Source Explorer** view from the **Window** > **Show View** > **Data Source Explorer** menu or switch to the **Database Perspective** (available from **Window** > **Open Perspective** > **Database**).

How to Configure a Generic JDBC Data Source

Starting with version 17, Oxygen XML Developer plugin comes bundled with Java 8, which does not provide built-in access to JDBC-ODBC data sources. To access such sources, you need to find an alternative JDBC-ODBC bridge or use a platform-independent distribution of Oxygen XML Developer plugin along with a Java VM version 7 or 6. The following procedure shows you how to configure a generic JDBC data source:

- 1. Open the **Preferences** dialog box and go to **Data Sources**.
- 2. Click the **New** button in the **Data Sources** panel.

- 3. Enter a unique name for the data source.
- **4.** Select *Generic JDBC* in the driver **Type** drop-down list.
- **5.** Add the driver file(s) using the **Add Files** button.
- **6.** Select the most appropriate **Driver class**.
- 7. Click the **OK** button to finish the data source configuration.

How to Configure a Generic JDBC Connection

To configure a connection to a generic JDBC database, follow these steps:

- 1. Open the Preferences dialog box and go to Data Sources.
- 2. In the Connections panel, click the **New** button.
- **3.** Enter a unique name for the connection.
- **4.** Select the *Generic JDBC* data source in the **Data Source** drop-down menu.
- 5. Enter the connection details.
 - a) Enter the URL of the generic JDBC database, with the following format:jdbc: <subprotocol>: <subname>.
 - b) Enter the user name for the connection to the generic JDBC database.
 - c) Enter the password for the connection to the generic JDBC database.
- **6.** Click the **OK** button to finish the configuration of the database connection.

How to Configure MySQL Support

To configure the support for a MySQL database follow this procedure:

- 1. Configure a MySQL Data Source driver.
- 2. Configure a MySQL Connection.
- 3. Use the **Data Source Explorer** view from the **Window** > **Show View** > **Data Source Explorer** menu or switch to the **Database Perspective** (available from **Window** > **Open Perspective** > **Database**).

How to Configure a MySQL Data Source

To connect to a MySQL server, create a data source of a generic JDBC type, based on *the MySQL JDBC driver available on the MySQL website*. The following steps describe how you can configure such a data source:

- 1. Open the Preferences dialog box and go to Data Sources.
- 2. Click the **New** button in the **Data Sources** panel.

The dialog box for configuring a data source is opened.

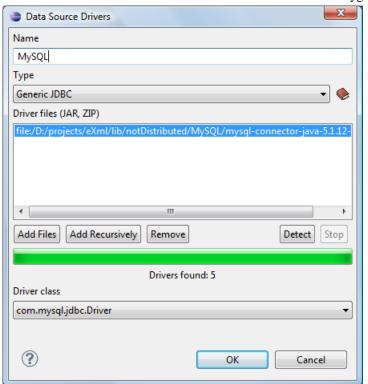

Figure 225: Data Source Drivers Configuration Dialog Box

- **3.** Enter a unique name for the data source.
- **4.** Select *Generic JDBC* in the driver **Type** drop-down list.
- 5. Add the MySQL driver files using the Add Files button.
 The driver file for the MySQL server is called mysql-com. jar. The Driver files section lists download links for database drivers that are necessary for accessing MySQL databases in Oxygen XML Developer plugin.
- **6.** Select the most appropriate **Driver class**.
- 7. Click the **OK** button to finish the data source configuration.

How to Configure a MySQL Connection

To configure a connection to a MySQL server, follow these steps:

- 1. Open the Preferences dialog box and go to Data Sources.
- 2. In the Connections panel, click the * New button.

The dialog box for configuring a database connection is displayed.

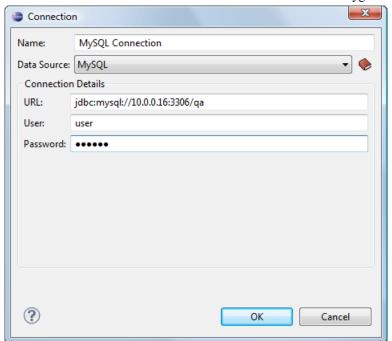

Figure 226: The Connection Configuration Dialog Box

- **3.** Enter a unique name for the connection.
- **4.** Select the *MySQL* data source in the **Data Source** drop-down list.
- **5.** Enter the connection details.
 - a) Enter the URL of the MySQL server.
 - b) Enter the user name for the connection to the MySQL server.
 - c) Enter the password for the connection to the MySQL server.
- **6.** Click the **OK** button to finish the configuration of the database connection.

How to Oracle 11g Support

To configure the support for a Oracle 11g database follow this procedure:

- 1. Go to the *Oracle website* and download the Oracle 11g JDBC driver called ojdbc6.jar.
- 2. Configure a Oracle 11g Data Source driver.
- **3.** Configure a Oracle 11g Connection.
- **4.** Use the **Data Source Explorer** view from the **Window** > **Show View** > **Data Source Explorer** menu or switch to the **Database Perspective** (available from **Window** > **Open Perspective** > **Database**).

How to Configure an Oracle 11g Data Source

Available in the Enterprise edition only.

The steps for configuring a data source for connecting to an Oracle 11g server are as follows:

- 1. Open the **Preferences** dialog box and go to **Data Sources**.
- 2. Click the ***** New button in the **Data Sources** panel.

The dialog box for configuring a data source is opened.

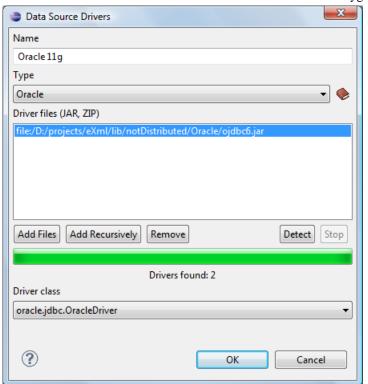

Figure 227: Data Source Drivers Configuration Dialog Box

- **3.** Enter a unique name for the data source.
- **4.** Select *Oracle* in the driver **Type** drop-down menu.
- 5. Add the Oracle driver file using the Add Files button.

 The Oracle driver file is called ojdbc5. jar. The Driver files section lists download links for database drivers that are necessary for accessing Oracle databases in Oxygen XML Developer plugin.
- **6.** Select the most appropriate **Driver class**.
- 7. Click the **OK** button to finish the data source configuration.

How to Configure an Oracle 11g Connection

Available in the Enterprise edition only.

The steps for configuring a connection to an Oracle 11g server are as follows:

- 1. Open the Preferences dialog box and go to Data Sources.
- 2. In the **Connections** panel, click the **New** button.

The dialog box for configuring a database connection is displayed.

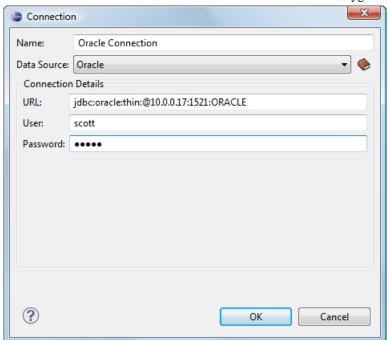

Figure 228: The Connection Configuration Dialog Box

- **3.** Enter a unique name for the connection.
- **4.** Select the *Oracle 11g* data source in the **Data Source** drop-down menu.
- 5. Enter the connection details.
 - a) Enter the URL of the Oracle server.
 - b) Enter the user name for the connection to the Oracle server.
 - c) Enter the password for the connection to the Oracle server.
- **6.** Click the **OK** button to finish the configuration of the database connection.

How to Configure PostgreSQL Support

To configure the support for a PostgreSQL database follow this procedure:

- 1. Go to the *PostgreSQL website* and download the PostgreSQL 8.3 JDBC driver called postgresql-8.3-603.jdbc3.jar.
- **2.** Configure a PostgreSQL Data Source driver.
- 3. Configure a PostgreSQL Connection.
- **4.** Use the **Data Source Explorer** view from the **Window** > **Show View** > **Data Source Explorer** menu or switch to the **Database Perspective** (available from **Window** > **Open Perspective** > **Database**).

How to Configure a PostgreSQL 8.3 Data Source

The steps for configuring a data source for connecting to a PostgreSQL server are as follows:

- 1. Open the **Preferences** dialog box and go to **Data Sources**.
- 2. Click the **New** button in the **Data Sources** panel.

The dialog box for configuring a data source is opened.

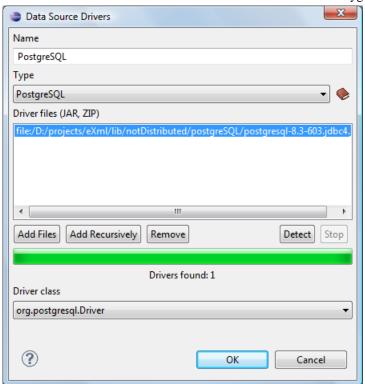

Figure 229: Data Source Drivers Configuration Dialog Box

- **3.** Enter a unique name for the data source.
- **4.** Select *PostgreSQL* in the driver **Type** drop-down list.

- **5.** Add the PostgreSQL driver file using the **Add Files** button.
 - The PostgreSQL driver file is called postgresql-8.3-603.jdbc3.jar. The **Driver files** section lists *download links for database drivers* that are necessary for accessing PostgreSQL databases in Oxygen XML Developer plugin.
- **6.** Select the most appropriate **Driver class**.
- 7. Click the **OK** button to finish the data source configuration.

How to Configure a PostgreSQL 8.3 Connection

The steps for configuring a connection to a PostgreSQL 8.3 server are as follows:

- 1. Open the Preferences dialog box and go to Data Sources.
- 2. In the Connections panel, click the **New** button.

The dialog box for configuring a database connection is displayed.

- **3.** Enter a unique name for the connection.
- **4.** Select the *PostgreSQL 8.3* data source in the **Data Source** drop-down menu.
- 5. Enter the connection details.
 - a) Enter the URL of the PostgreSQL 8.3 server.
 - b) Enter the user name for the connection to the PostgreSQL 8.3 server.
 - c) Enter the password for the connection to the PostgreSQL 8.3 server.
- **6.** Click the **OK** button to finish the configuration of the database connection.

How to Configure JDBC-ODBC Support

To configure the support for a JDBC-ODBC database follow this procedure:

- 1. Configure a JDBC-ODBC *Data Source* driver.
- **2.** Configure a JDBC-ODBC Connection.
- 3. Use the **Data Source Explorer** view from the **Window** > **Show View** > **Data Source Explorer** menu or switch to the **Database Perspective** (available from **Window** > **Open Perspective** > **Database**).

How to Configure a JDBC-ODBC Connection

Starting with version 17, Oxygen XML Developer plugin comes bundled with Java 8, which does not provide built-in access to JDBC-ODBC data sources. To access such sources, you need to find an alternative JDBC-ODBC bridge or use a platform-independent distribution of Oxygen XML Developer plugin along with a Java VM version 7 or 6. To configure a connection to an ODBC data source, follow these steps:

- 1. Open the Preferences dialog box and go to Data Sources.
- 2. In the Connections panel, click the * New button.

The dialog box for configuring a database connection is displayed.

Figure 232: The Connection Configuration Dialog Box

- **3.** Enter a unique name for the connection.
- **4.** Select *JDBC-ODBC Bridge* in the **Data Source** drop-down list.
- **5.** Enter the connection details.
 - a) Enter the URL of the ODBC source.
 - b) Enter the user name of the ODBC source.
 - c) Enter the password of the ODBC source.
- **6.** Click the **OK** button to finish the configuration of the database connection.

Resource Management

This section explains resource management actions for relational databases.

Data Source Explorer View

The **Data Source Explorer** view displays your database connections. You can connect to a database simply by expanding the connection node. The database structure can be expanded to the column level. Oxygen XML Developer plugin supports multiple simultaneous database connections and the connection tree provides an easy method for browsing them.

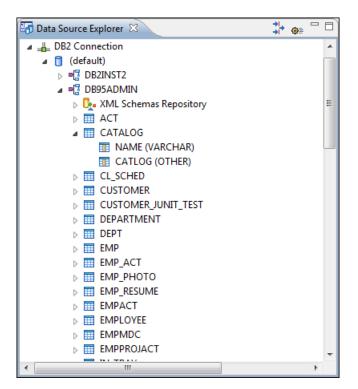

Figure 233: Data Source Explorer View

The following objects are displayed in the **Data Source Explorer** view:

- Lonnection
- Collection (Catalog)
- Language Marchanne Marc
- XML Schema Component
- Schema
- III Table
- System Table
- III Table Column
- A **Occilection** (called *catalog* in some databases) is a hierarchical container for resources and sub-collections. There are two types of resources:
- XML resource An XML document or document fragment, selected by a previously executed XPath query.
- Inon-XML resource -Any resource that is not recognized as XML.
- **Note:** For some connections you can add or move resources into a container by dragging them from:
 - The **Project view**.
 - The default file system application (for example, Windows Explorer in Windows or Finder in Mac OS X).
 - Another database container.

The following actions are available in the toolbar of this view:

Filters

Opens the **Data Sources** / **Table Filters** *Preferences page*, allowing you to decide which table types are displayed in the **Data Source Explorer** view.

© Configure Database Sources

Opens the **Data Sources** preferences page where you can configure both data sources and connections.

Actions Available at Connection Level in Data Source Explorer View

The contextual menu of a — Connection node in the tree from the **Data Source Explorer** view contains the following actions:

C Refresh

Performs a refresh for the sub-tree of the selected node.

Disconnect

Closes the current database connection. If a table is already open, you are warned to close it before proceeding.

⊚ Configure Database Sources

Opens the *Data Sources preferences page* where you can configure both data sources and connections.

Actions Available at Catalog Level in Data Source Explorer View

The contextual menu of a Catalog node in the tree from the Data Source Explorer view contains the following actions:

C Refresh

Performs a refresh for the sub-tree of the selected node.

Actions Available at Schema Level in Data Source Explorer View

The contextual menu of a Schema node in the tree from the **Data Source Explorer** view contains the following actions:

C Refresh

Performs a refresh for the sub-tree of the selected node.

Actions Available at Table Level in Data Source Explorer View

The contextual menu of a **Table** node in the tree from the **Data Source Explorer** view contains the following actions:

C Refresh

Performs a refresh for the sub-tree of the selected node.

Edit

Opens the selected table in the **Table Explorer** view.

Export to XML

Opens the **Export Criteria** dialog box (a thorough description of this dialog box can be found in the *Import from Database* chapter).

XML Schema Repository Level

This section explains the actions available at the XML Schema Repository level.

Oracle XML Schema Repository Level

The Oracle database supports XML schema repository (XSR) in the database catalogs. The contextual menu of a XML Schema Repository node in the tree from the Data Source Explorer view contains the following actions:

C Refresh

Performs a refresh for the sub-tree of the selected node.

Register

Opens a dialog box for adding a new schema file in the XML repository. To add an XML Schema, enter the schema URI and location on your file system. *Local* scope means that the schema is visible only to the user who registers it. *Global* scope means that the schema is public.

Note: Registering a schema may involve dropping/creating types. Hence you need type-related privileges such as DROP TYPE, CREATE TYPE, and ALTER TYPE. You need privileges to delete and register the XML schemas involved in the registering process. You need all privileges on XMLType tables that conform to the registered schemas. For XMLType columns, the ALTER TABLE privilege is needed on corresponding tables. If there are schema-based XMLType tables or columns in other database schemas, you need privileges such as the following:

- CREATE ANY TABLE
- CREATE ANY INDEX
- SELECT ANY TABLE
- UPDATE ANY TABLE
- INSERT ANY TABLE
- DELETE ANY TABLE
- DROP ANY TABLE
- ALTER ANY TABLE
- DROP ANY INDEX

To avoid having to grant all these privileges to the schema owner, Oracle recommends that the registration be performed by a DBA if there are XML schema-based XMLType table or columns in other user database schemas.

IBM DB2 XML Schema Repository Level

The contextual menu of a ML Schema Repository node in the tree from the Data Source Explorer view contains the following actions:

C Refresh

Performs a refresh for the sub-tree of the selected node.

Register

Opens a dialog box for adding a new schema file in the XML Schema repository. In this dialog box, the following fields can be set:

- XML schema file Location on your file system.
- XSR name Schema name.
- Comment Short comment (optional).
- Schema location Primary schema name (optional).

Decomposition means that parts of the XML documents are stored in relational tables. Which parts map to which tables and columns are specified in the schema annotations. Schema dependencies management is done by using the **Add** and **Remove** buttons.

The actions available at **Schema** level are as follows:

C Refresh

Performs a refresh of the selected node (and its sub-tree).

Unregister

Removes the selected schema from the XML Schema Repository.

Opens the selected schema in Oxygen XML Developer plugin.

The contextual menu of a **XML Schema Repository** node in the tree from the **Data Source Explorer** view contains the following actions:

C Refresh

Performs a refresh for the sub-tree of the selected node.

Register

Opens a dialog box for adding a new schema file in the DB XML repository. In this dialog box, you enter a collection name and the necessary schema files. XML Schema files management is done by using the **Add** and **Remove** buttons

The actions available at Schema level are as follows:

C Refresh

Performs a refresh of the selected node (and its sub-tree).

Add

Adds a new schema to the XML Schema files.

Unregister

Removes the selected schema from the XML Schema Repository.

Opens the selected schema in Oxygen XML Developer plugin.

Table Explorer View

Every table from the **Data Source Explorer** view can be displayed and edited in the **Table Explorer** view by pressing the **Edit** button from the contextual menu or by double-clicking one of its fields. To modify the content of a cell, double-click it and start typing. When editing is complete, Oxygen XML Developer plugin attempts to update the database with the new cell content.

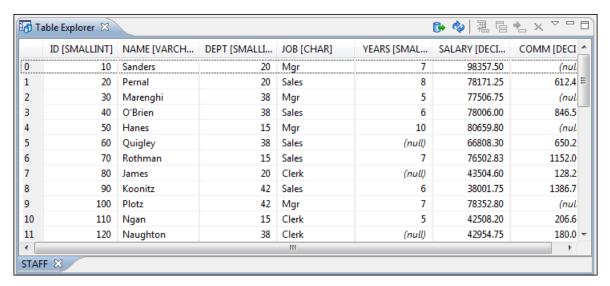

Figure 234: The Table Explorer View

You can sort the content of a table by one of its columns by clicking its column header.

Note the following:

- The first column is an index (not part of the table structure)
- Every column header contains the field name and its data type
- The primary key columns are marked with this symbol:

Multiple tables are presented in a tabbed manner

For performance issues, you can set the maximum number of cells that are displayed in the **Table Explorer** view (using the **Limit the number of cells** field from the *Data Sources* Preferences page). If a table that has more cells than the value set in the options is displayed in the **Table Explorer** view, a warning dialog box informs you that the table is only partially shown.

You are notified if the value you have entered in a cell is not valid (and thus cannot be updated).

- If the content of the edited cell does not belong to the data type of the column, an information dialog box appears, notifying you that the value you have inserted cannot be converted to the SQL type of that field. For example, if you have a column that contains LONG (numerical) values, and a character or string is inserted into one of its cells, you would get the error message that a string value cannot be converted to the requested SQL type (NUMBER).
- If the constraints of the database are not met (for instance, primary key constraints), an information dialog box will appear, notifying you of the reason the database has not been updated. For example, in the table below, trying to set the second record in the primary key propID column to 8, results in a duplicate entry error since that value has already been used in the first record:

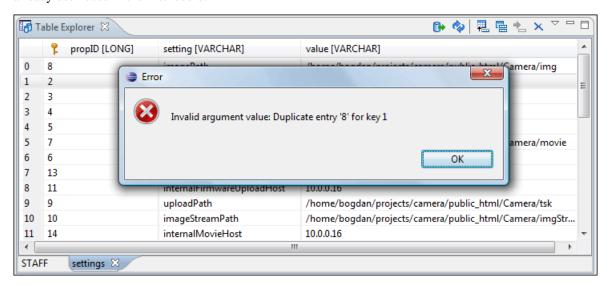

Figure 235: Duplicate Entry for Primary Key

Common edit actions (Cut, Copy, Paste, Select All, Undo, Redo) are available in the contextual menu of an edited cell.

The contextual menu, available on every cell, also has the following actions:

Set NULL

Sets the content of the cell to null. This action is disabled for columns that cannot have a value of null.

■ Insert row

Inserts an empty row in the table.

Duplicate row

Makes a copy of the selected row and adds it in the **Table Explorer** view. Note that the new row will not be inserted in the database table until all conflicts are resolved.

L Commit row

Commits the selected row.

X Delete row

Deletes the selected row.

Copies the content of the cell.

Paste

Pastes copied content into the selected cell.

The **Table Explorer** toolbar also includes the following actions:

Export to XML

Opens the **Export Criteria** dialog box (a thorough description of this dialog box can be found in the *Import from database* chapter).

C Refresh

Performs a refresh for the sub-tree of the selected node.

■ Insert row

Inserts an empty row in the table.

Duplicate row

Makes a copy of the selected row and adds it in the **Table Explorer** view. Note that the new row will not be inserted in the database table until all conflicts are resolved.

Commit row

Commits the selected row.

X Delete row

Deletes the selected row.

SQL Execution Support

Oxygen XML Developer plugin's support for writing SQL statements includes syntax highlighting, folding, and dragging and dropping from the **Data Source Explorer** view. It also includes transformation scenarios for executing the statements, and the results are displayed in the **Table Explorer** view.

Drag and Drop from Data Source Explorer View

Drag and drop operations from the **Data Source Explorer** view to the SQL Editor allows you to create SQL statements quickly by inserting the names of tables and columns in the SQL statements.

- 1. Configure a database connection (see the specific procedure for your database server).
- 2. Browse to the table you will use in your statement.
- **3.** Drag the table or a column of the table into the editor where a SQL file is open.

Drag and drop actions are available both on the table and on its fields. A pop-up menu is displayed in the SQL editor.

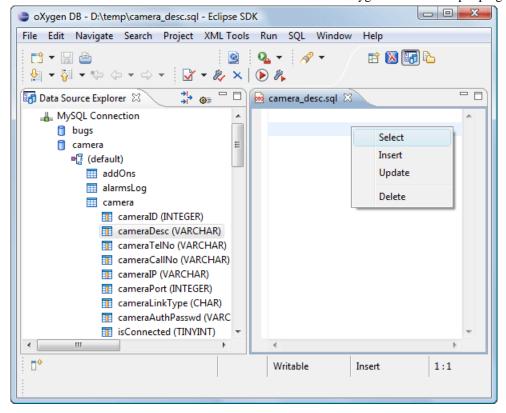

Figure 236: SQL Statement Editing with Drag and Drop

4. Select the type of statement from the pop-up menu.

Depending on your choice, dragging a table results in one of the following statements being inserted into the document:

- SELECT `field1`, `field2`, FROM `catalog`.`table` (for example: SELECT `DEPT`, `DEPTNAME`, `LOCATION` FROM `camera`.`cameraDesc`)
- UPDATE `catalog`.`table` SET `field1`=, `field2`=,.... (for example: UPDATE `camera`.`cameraDesc` SET `DEPT`=, `DEPTNAME`=, `LOCATION`=)
- INSERT INTO `catalog`. `table` (`field1`, field2`,) VALUES (, ,) (for example: INSERT INTO `camera`. `cameraDesc` (`DEPT`, `DEPTNAME`, `LOCATION`) VALUES (, ,))
- DELETE FROM `catalog`. `table` (for example: DELETE FROM `camera`. `cameraDesc`)

Depending on your choice, dragging a column results in one of the following statements being inserted into the document:

- SELECT`field`FROM`catalog`.`table`(for example: SELECT `DEPT` FROM `camera`.`cameraDesc`
)
- UPDATE `catalog`.`table` SET `field` = (for example: UPDATE `camera`.`cameraDesc` SET `DEPT`=)
- INSERT INTO`catalog`.`table`(`field1) VALUES()(for example: INSERT INTO `camera`.`cameraDesc` (`DEPT`) VALUES())
- DELETE FROM `catalog`.`table` (for example: DELETE FROM `camera`.`cameraDesc` WHERE `DEPT`=)

SQL Validation

SQL validation support is offered for IBM DB2. Note that if you choose a connection that does not support SQL validation, you will receive a warning when trying to validate. The SQL document is validated using the connection from the associated transformation scenario.

Executing SQL Statements

The steps for executing an SQL statement on a relational database are as follows:

1. Configure a *transformation scenario* using the Configure Transformation Scenario(s) action from the Transformation toolbar or the XML menu.

A SQL transformation scenario needs a database connection. You can configure a connection using the Preferences button from the SQL transformation dialog box.

The dialog box contains the list of existing scenarios that apply to SQL documents.

2. Set parameter values for SQL placeholders using the **Parameters** button from the SQL transformation dialog box. For example, in SELECT * FROM `test`.`department` where DEPT = ? or DEPTNAME = ? the two parameters can be configured for the place holders (?) in the transformation scenario.

When the SQL statement is executed, the first placeholder is replaced with the value set for the first parameter in the scenario, the second placeholder is replaced by the second parameter value, and so on.

- **Restriction:** When a stored procedure is called in an SQL statement executed on an SQL Server database, mixing in-line parameter values with values specified using the **Parameters** button of the scenario dialog box is not recommended. This is due to a limitation of the SQL Server driver for Java applications. An example of stored procedure that is not recommended: call dbo.Test(22, ?).
- 3. Execute the SQL scenario by clicking the **OK** or **Apply associated** button.

The result of a SQL transformation is *displayed in a view* at the bottom of the Oxygen XML Developer plugin window.

4. View more complex return values of the SQL transformation in a separate editor panel.

A more complex value returned by the SQL query (for example, an *XMLTYPE* or *CLOB* value) cannot be displayed entirely in the result table.

- a) Right-click the cell containing the complex value.
- b) Select the action **Copy cell** from the contextual menu. The action copies the value in the clipboard.
- c) Paste the value into an appropriate editor.For example, you can paste the value in an opened XQuery editor panel of Oxygen XML Developer plugin.

Native XML Database (NXD) Support

Native XML databases have an XML-based internal model and their fundamental unit of storage is XML. Oxygen XML Developer plugin offers support for the following native XML databases:

- · Berkeley DB XML
- eXist
- MarkLogic
- Documentum xDb (X-Hive/DB) 10
- Oracle XML DB

To watch our video demonstration about the integration between the XML native databases and Oxygen XML Developer plugin, go to http://www.oxygenxml.com/demo/Author_Database_XML_Native.html.

Configuring Native XML Database Data Sources

This section describes the procedures for configuring the following native database data sources:

- Berkeley DB XML
- eXist
- MarkLogic

• Documentul xDB (X-Hive/DB) 10

Configuring Database Connections

This section describes the procedures for configuring the connections for the following native databases:

- Berkeley DB XML
- eXist
- MarkLogic
- Documentum xDb (X-Hive/DB) 10

How to Configure Support for Native XML Databases

This section contains procedures about configuring the support for various native XML databases.

How to Configure Berkeley DB XML Support

Follow this procedure to configure the support for a Berkeley DB XML database:

- **1.** Configure a Berkeley DB XML Data Source driver.
- 2. Configure a Berkeley DB XML Connection.
- 3. Use the **Data Source Explorer** view from the **Window** > **Show View** > **Data Source Explorer** menu or switch to the **Database Perspective** (available from **Window** > **Open Perspective** > **Database**).

How to Configure a Berkeley DB XML Data Source

Oxygen XML Developer plugin supports Berkeley DB XML versions 2.3.10, 2.4.13, 2.4.16 & 2.5.16. The steps for configuring a data source for a Berkeley DB XML database are as follows:

- 1. Open the **Preferences** dialog box and go to **Data Sources**.
- 2. Click the New button in the Data Sources panel.
- 3. Enter a unique name for the data source.
- **4.** Select *Berkeley DBXML* from the driver **Type** drop-down menu.
- **5.** Click the **Add** button to add the Berkeley DB driver files.

The driver files for the Berkeley DB database are the following:

- db.jar (check for it in [DBXML_DIR]/lib or [DBXML_DIR]/jar)
- dbxml.jar (check for it in [DBXML_DIR]/lib or [DBXML_DIR]/jar)

Where [DBXML_DIR] is the Berkeley DB XML database root directory. For example, in Windows it is: C:\Program Files\Oracle\Berkeley DB XML <version>.

6. Click the **OK** button to finish the data source configuration.

How to Configure a Berkeley DB XML Connection

Oxygen XML Developer plugin supports Berkeley DB XML versions 2.3.10, 2.4.13, 2.4.16 & 2.5.16. The steps for configuring a connection to a Berkeley DB XML database are as follows:

- 1. Open the Preferences dialog box and go to Data Sources.
- 2. Click the **New** button in the **Connections** panel.
- **3.** Enter a unique name for the connection.
- 4. Select one of the previously configured data sources from the Data Source drop-down menu.
- **5.** Enter the connection details.
 - a) Set the path to the Berkeley DB XML database directory in the Environment home directory field. Use a directory with write access. DO NOT use the installation directory where Berkeley DB XML is installed if you do not have write access to that directory.
 - b) Select the **Verbosity** level: *DEBUG*, *INFO*, *WARNING*, or *ERROR*.
 - c) Optionally, you can select the check-box **Join existing environment**.

If checked, an attempt is made to join an existing environment in the specified home directory and all the original environment settings are preserved. If that fails, try reconfiguring the connection with this option unchecked.

6. Click the **OK** button to finish the connection configuration.

How to Configure eXist Support

Follow this procedure to configure the support for an eXist database:

- **1.** Configure a eXist Data Source driver.
- **2.** Configure a eXist Connection.
- 3. Use the **Data Source Explorer** view from the **Window** > **Show View** > **Data Source Explorer** menu or switch to the **Database Perspective** (available from **Window** > **Open Perspective** > **Database**).

How to Configure an eXist Data Source

Oxygen XML Developer plugin supports eXist database server versions up to and including version 2.2. The steps for configuring a data source for an eXist database are as follows:

- 1. Open the Preferences dialog box and go to Data Sources.
- 2. Click the New button in the Data Sources panel.
- 3. Enter a unique name for the data source.
- **4.** Select *eXist* from the driver **Type** drop-down menu.
- 5. Click the **Add** button to add the eXist driver files.

The following driver files should be added in the dialog box for setting up the eXist datasource. They are found in the installation directory of the eXist database server. Make sure you copy the files from the installation of the eXist server where you want to connect from Oxygen XML Developer plugin.

- exist.jar
- lib/core/xmldb.jar
- lib/core/xmlrpc-client-3.1.x.jar
- lib/core/xmlrpc-common-3.1.x.jar
- lib/core/ws-commons-util-1.0.x.jar
- lib/core/slf4j-api-1.x.x.jar(if available)
- lib/core/slf4j-log4j12-1.x.x.jar(if available)

The version number from the driver file names may be different for your eXist server installation.

6. Click the **OK** button to finish the connection configuration.

To watch our video demonstration about running XQuery against an eXist XML database, go to http://www.oxygenxml.com/demo/eXist_Database.html.

How to Configure an eXist Connection

The steps for configuring a connection to an eXist database are as follows:

- 1. Open the Preferences dialog box and go to Data Sources.
- 2. Click the **New** button in the **Connections** panel.
- **3.** Enter a unique name for the connection.
- 4. Select one of the previously configured data sources from the Data Source drop-down menu.
- **5.** Enter the connection details.
 - a) Set the URI to the installed eXist engine in the XML DB URI field.
 - b) Set the user name in the **User** field.
 - c) Set the password in the **Password** field.
 - d) Enter the start collection in the Collection field.
 - eXist organizes all documents in hierarchical collections. Collections are like directories. They are used to group related documents together. This text field allows the user to set the default collection name.

6. Click the **OK** button to finish the connection configuration.

To watch our video demonstration about running XQuery against an eXist XML database, go to http://www.oxygenxml.com/demo/eXist_Database.html.

The Create eXist-db XML Connection Dialog Box

A quick way to create an eXist connection is to use the dedicated **Create eXist-db XML connection** dialog box. *Open the Preferences dialog box*, go to **Data Sources** and click the **Create eXist-db XML connection** link. After you fill in the fields, click **OK** and go to **Window** > **Show View** > **Data Source Explorer** to view your connection.

To create an eXist connection using this dialog box, Oxygen XML Developer plugin expects the exist/webstart/exist.jnlp path to be accessible at the provided **Host** and **Port**.

How to Configure MarkLogic Support

Follow this procedure to configure the support for a MarkLogic database:

- **1.** Download the MarkLogic driver from *MarkLogic Community site*.
- 2. Configure a MarkLogic Data Source driver.
- 3. Configure a MarkLogic Connection.
- **4.** Use the **Data Source Explorer** view from the **Window** > **Show View** > **Data Source Explorer** menu or switch to the **Database Perspective** (available from **Window** > **Open Perspective** > **Database**).

How to Configure a MarkLogic Data Source

Available in the Enterprise edition only.

Note: Oxygen XML Developer plugin supports MarkLogic version 4.0 or later.

- 1. Open the **Preferences** dialog box and go to **Data Sources**.
- 2. Click the **New** button in the **Data Sources** panel.
- **3.** Enter a unique name for the data source.
- **4.** Select *MarkLogic* from the driver **Type** drop-down list.
- 5. Click the **Add** button to add the MarkLogic driver file (marklogic-xcc-{server_version}, where *(server_version)* is the MarkLogic server version.)

You can download the driver file from: http://community.marklogic.com/download.

6. Click the **OK** button to finish the data source configuration.

How to Configure a MarkLogic Connection

Available in the Enterprise edition only.

Note: Oxygen XML Developer plugin supports MarkLogic version 4.0 or later.

The steps for configuring a connection to a MarkLogic database are as follows:

- 1. Open the **Preferences** dialog box and go to **Data Sources**.
- 2. Click the **New** button in the **Connections** panel.
- **3.** Enter a unique name for the connection.
- 4. Select one of the previously configured data sources from the **Data Source** drop-down menu.
- 5. Enter the connection details.
 - a) The host name or IP address of the installed MarkLogic engine in the **XDBC Host** field.
 - Oxygen XML Developer plugin uses XCC connector to interact with MarkLogic XDBC server and requires the basic authentication schema to be set. Starting with version MarkLogic 4.0 the default authentication method when you create a HTTP or WebDAV Server is *digest*, so make sure to change it to *basic*.
 - b) Set the port number of the MarkLogic engine in the **Port** field. A MarkLogic XDBC application server must be configured on the server on this port. This XDBC server will be used to process XQuery expressions against the

server. Later, if you want to change the XDBC server, instead of editing the configuration just use the *Use it to execute queries* action from Data Source Explorer.

- c) Set the user name to access the MarkLogic engine in the **User** field.
- d) Set the password to access the MarkLogic engine in the **Password** field.
- e) Optionally set the URL used for browsing the MarkLogic database in the Data Source Explorer view in the WebDAV URL field.

The **Database** field specifies the database over which the XQuery expressions are executed. If you set this option to default, the database associated to the application server of the configured port is used.

6. Click the **OK** button to finish the connection configuration.

How to Configure Documentum xDb (X-Hive/DB) 10 Support

Follow this procedure to configure the support for a Documentum xDb (X-Hive/DB) 10 database:

- **1.** Configure a Documentum xDb Data Source driver.
- **2.** Configure a Documentum xDb Connection.
- 3. Use the **Data Source Explorer** view from the **Window** > **Show View** > **Data Source Explorer** menu or switch to the **Database Perspective** (available from **Window** > **Open Perspective** > **Database**).

How to Configure a Documentum xDb (X-Hive/DB) 10 Data Source

Available in the Enterprise edition only.

- 1. Open the **Preferences** dialog box and go to **Data Sources**.
- 2. Click the **New** button in the **Data Sources** panel.
- 3. Enter a unique name for the data source.
- **4.** Select *XHive* from the driver **Type** drop-down menu.
- 5. Click the **Add** button to add the XHive driver files.

The driver files for the Documentum xDb (X-Hive/DB) 10 database are found in the Documentum xDb (X-Hive/DB) 10 lib directory from the server installation folder:

- antlr-runtime.jar
- aspectjrt.jar
- icu4j.jar
- xhive.jar
- google-collect.jar
- **6.** Click the **OK** button to finish the data source configuration.

How to Configure an Documentum xDb (X-Hive/DB) 10 Connection

The steps for configuring a connection to a Documentum xDb (X-Hive/DB) 10 database are as follows:

- Note: The bootstrap type of X-Hive/DB connections is not supported in Oxygen XML Developer plugin. The following procedure explains the xhive://protocol connection type.
- 1. Open the **Preferences** dialog box and go to **Data Sources**.
- 2. Click the **New** button in the **Connections** panel.
- **3.** Enter a unique name for the connection.
- 4. Select one of the previously configured data sources from the **Data Source** drop-down menu.
- **5.** Enter the connection details.
 - a) Set the URL property of the connection in the **URL** field.

 If the property is a URL of the form *xhive://host:port*, the Documentum xDb (X-Hive/DB) 10 connection will attempt to connect to a Documentum xDb (X-Hive/DB) 10 server running behind the specified TCP/IP port.
 - b) Set the user name to access the Documentum xDb (X-Hive/DB) 10 engine in the **User** field.

- c) Set the password to access the Documentum xDb (X-Hive/DB) 10 engine in the **Password** field.
- d) Set the name of the database to access from the Documentum xDb (X-Hive/DB) 10 engine in the **Database** field.
- e) Check the **Run XQuery in read / write session (with committing)** checkbox if you want to end the session with a commit. Otherwise, the session ends with a rollback.
- **6.** Click the **OK** button to finish the connection configuration.

Data Source Explorer View

The **Data Source Explorer** view displays your database connections. You can connect to a database simply by expanding the connection node. The database structure can be expanded to the column level. supports multiple simultaneous database connections and the connection tree provides an easy method for browsing them.

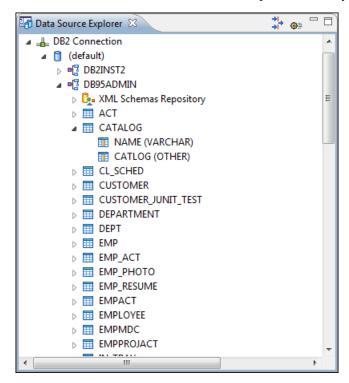

Figure 237: Data Source Explorer View

The following objects are displayed in the **Data Source Explorer** view:

- description
- Collection (Catalog)
- V XML Schema Repository
- XML Schema Component
- 🛂 Schema
- 🖩 Table
- System Table
- II Table Column

A **Occilection** (called *catalog* in some databases) is a hierarchical container for resources and sub-collections. There are two types of resources:

- **XML resource** An XML document or document fragment, selected by a previously executed XPath query.
- **In non-XML resource** -Any resource that is not recognized as XML.

Note: For some connections you can add or move resources into a container by dragging them from:

- The **Project view**.
- The default file system application (for example, Windows Explorer in Windows or Finder in Mac OS X).
- Another database container.

The following actions are available in the toolbar of this view:

Filters

Opens the **Data Sources** / **Table Filters** *Preferences page*, allowing you to decide which table types are displayed in the **Data Source Explorer** view.

© Configure Database Sources

Opens the **Data Sources** preferences page where you can configure both data sources and connections.

Oracle XML DB Browser

Oracle XML DB is a feature of the Oracle database. It provides a high-performance, native XML storage and retrieval technology. Oxygen XML Developer plugin allows you to browse the native Oracle XML Repository and perform various operations on the resources in the repository.

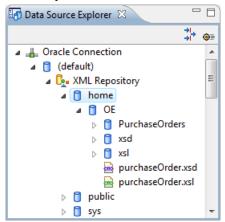

Figure 238: Browsing the Oracle XML DB Repository

The actions available at XML Repository level are as follows:

C Refresh

Performs a refresh of the XML Repository.

Add container

Adds a new child container to the XML Repository.

Add resource

Adds a new resource to the XML Repository.

The actions available at container level are as follows:

C Refresh

Performs a refresh of the selected container.

Add container

Adds a new child container to the current one.

Add resource

Adds a new resource to the folder.

Delete

Deletes the current container.

Properties

Shows various properties of the current container.

The actions available at resource level are as follows:

C Refresh

Performs a refresh of the selected resource.

Open

Opens the selected resource in the editor.

Rename

Renames the current resource

Move

Moves the current resource to a new container (also available through drag and drop).

Delete

Deletes the current resource.

Copy location

Allows you to copy (to the clipboard) an application-specific URL for the resource that can then be used for various actions, such as opening or transforming the resources.

Properties

Shows various properties of the current resource.

Compare

Compares the resources using Diff Files (this action is available in the contextual menu of two selected resources).

For running an XQuery transformation on collections from the XML Repository, see a tutorial from Oracle.

PostgreSQL Connection

Oxygen XML Developer plugin allows you to browse the structure of the PostgreSQL database in the **Data Source Explorer** view and open the tables in the **Table Explorer** view.

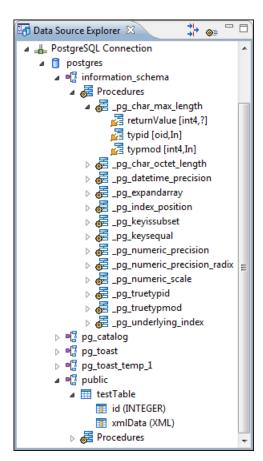

Figure 239: Browsing a PostgreSQL repository

The actions available at container level are as follows:

C Refresh

Performs a refresh of the selected container.

The actions available at resource level are as follows:

C Refresh

Performs a refresh of the selected database table.

■ Edit

Opens the selected database table in the **Table Explorer** view.

Export to XML

Exports the content of the selected database table as an XML file using the dialog box from importing data from a database.

Compare

Compares the resources using Diff Files (this action is available in the contextual menu of two selected resources).

Berkeley DB XML Connection

This section explains the actions that are available on a Berkeley DB XML connection.

Actions Available at Connection Level

In a Berkeley DB XML repository, the actions available at connection level in the **Data Source Explorer** view are as follows:

Performs a refresh for the sub-tree of the selected node.

Disconnect

Closes the current database connection.

© Configure Database Sources

Opens the Data Sources preferences page where you can configure both data sources and connections.

Add container

Adds a new container in the repository with the following attributes:

- Name The name of the new container.
- Container type At creation time, every container must have a type defined for it. This container type identifies
 how XML documents are stored in the container. As such, the container type can only be determined at container
 creation time. You cannot change it when subsequent container opens. Containers can have one of the following
 types specified for them:
 - Node container XML documents are stored as individual nodes in the container. Each record in the
 underlying database contains a single leaf node, its attributes and attribute values (if any), and its text nodes
 (if any). Berkeley DB XML also keeps the information it requires to reassemble the document from the
 individual nodes stored in the underlying databases. This is the default, and preferred, container type.
 - Whole document container The container contains entire documents. The documents are stored without any manipulation of line breaks or whitespace.
- Allow validation If checked, it causes documents to be validated when they are loaded into the container. The
 default behavior is to not validate documents.
- Index nodes If checked, it causes indices for the container to return nodes rather than documents. The default
 is to index at the document level. This property has no meaning if the container type is Whole document
 container.

Properties

Displays a dialog box that contains a list of the Berkeley connection properties (version, home location, default container type, compression algorithm, etc.)

Actions Available at Container Level

In a Berkeley DB XML repository, the actions available at container level in the **Data Source Explorer** view are as follows:

실 Add Resource

Adds a new XML resource to the selected container.

Rename

Allows you to specify a new name for the selected container.

Delete

Removes the selected container from the database tree.

Edit indices

Allows you to edit the indices for the selected container.

C Refresh

Performs a refresh for the sub-tree of the selected node.

Properties

Displays a dialog box with a list of properties of the Berkeley container (such as *container type*, *auto indexing*, *page size*, *validate on load*, *compression algorithm*, *number of documents*, etc.)

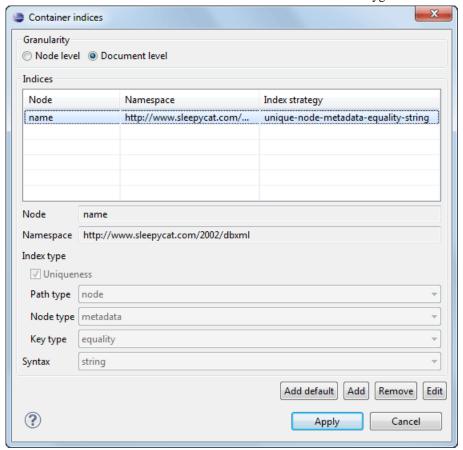

Figure 240: Container indices

The fields of the dialog box are as follows:

- Granularity:
 - **Document level** Good option for retrieving large documents.
 - Node level Good option for retrieving nodes from within documents.
- Add / Edit indices:
 - **Node** The node name.
 - Namespace The index namespace.
 - Index strategy:
 - Index type:
 - Uniqueness Indicates whether the indexed value must be unique within the container.
 - Path type:
 - **node** Indicates that you want to index a single node in the path.
 - edge Indicates that you want to index the portion of the path where two nodes meet.
 - Node type:
 - **element** An element node in the document content.
 - attribute An attribute node in the document content.
 - metadata A node found only in the metadata content of a document.
 - Key type:
 - equality Improves the performances of tests that look for nodes with a specific value.

- presence Improves the performances of tests that look for the existence of a node regardless of its
 value.
- **substring** Improves the performance of tests that look for a node whose value contains a given sub-string.
- Syntax types The syntax describes the type of data the index contains and is mostly used to determine how
 indexed values are compared.

Actions Available at Resource Level

In a Berkeley DB XML repository, the actions available at resource level in the **Data Source Explorer** view are as follows:

C Refresh

Performs a refresh of the selected resource.

Open

Opens the selected resource in the editor.

Rename

Allows you to change the name of the selected resource.

Move

Allows you to move the selected resource in a different container in the database tree (also available through drag and drop).

X Delete

Removes the selected resource from the container.

Copy location

Allows you to copy (to the clipboard) an application-specific URL for the resource that can then be used for various actions, such as opening or transforming the resources.

Compare

Compares the resources using Diff Files (this action is available in the contextual menu of two selected resources).

eXist Connection

This section explains the actions that are available on an eXist connection.

Actions Available at Connection Level

For an eXist database, the actions available at connection level in the **Data Source Explorer** view are as follows:

© Configure Database Sources

Opens the **Data Sources** preferences page where you can configure both data sources and connections.

Disconnect

Closes the current database connection.

C Refresh

Performs a refresh for the sub-tree of the selected node.

Actions Available at Container Level

For an eXist database, the actions available at container level in the Data Source Explorer view are as follows:

New File

Creates a file in the selected container.

New Collection

Creates a collection.

Import Folders

Adds the content of specified folders from the local file system.

Import Files

Adds a set of XML resources from the local file system.

Cut

Cuts the selected containers.

Copy

Copies the selected containers.

Note: You can add or move resources into the container by dragging them from the **Project** view, the default file management application (for example, Windows Explorer on Windows or Finder on OS X), or from another database container.

Paste

Paste resources into the selected container.

Rename

Allows you to change the name of the selected collection.

× Delete

Removes the selected collection.

C Refresh

Performs a refresh of the selected container.

Properties

Allows you to view various useful properties associated with the container, such as *name*, *creation date*, *owner*, *group*, or *permissions*.

Actions Available at Resource Level

For an eXist database, the actions available at resource level in the **Data Source Explorer** view are as follows:

C Refresh

Performs a refresh of the selected resource.

Open

Opens the selected resource in the editor.

Rename

Allows you to change the name of the selected resource.

Cut

Cuts the selected resources.

Copy

Copies the selected resources.

Note: You can add or move resources into the container by dragging them from the **Project** view, the default file management application (for example, Windows Explorer on Windows or Finder on OS X), or from another database container.

Paste

Pastes the copied resources.

X Delete

Removes the selected resource from the collection.

Copy location

Allows you to copy (to the clipboard) an application-specific URL for the resource that can then be used for various actions, such as opening or transforming the resources.

Properties

Allows you to view various useful properties associated with the resource.

Save As

Allows you to save the name of the selected binary resource as a file on disk.

Compare

Compares the resources using Diff Files (this action is available in the contextual menu of two selected resources).

MarkLogic Connection

Once you configure a MarkLogic connection, you can use the **Data Source Explorer** view to display all the application servers that are configured on the server. You can expand each application server and view all the modules that it is configured to use. The **Data Source Explorer** view allows you to open and edit these modules.

Note: To browse modules located in a database, directory properties must be associated with them. These directory properties are generated automatically if the *directory creation* property of the database is set to automatic. If this property is set to *manual* or *manual-enforced*, add the directory properties of the modules manually, using the XQuery function xdmp:directory-create(). For example, for two documents with the /code/modules/main.xqy and /code/modules/imports/import.xqy IDs, run this query: (xdmp:directory-create('/code/modules/'), xdmp:directory-create('/code/modules/imports/')).

For further information about directory properties go to: http://blakeley.com/blogofile/2012/03/19/directory-assistance/.

When you execute or debug XQuery files opened from this view, the imported modules are better identified by the MarkLogic server. In a module, you are also able to add breakpoints that the debugger takes into account.

Note: Add breakpoints in the modules of the application server that executes the debugging.

Note: Open XQuery modules from the application server involved in the debugging or execution process.

In the **Requests** container of each application server, Oxygen XML Developer plugin displays both the queries that are stopped for debugging purposes and the queries that are still running. To clean up the entire **Requests** container at the end of your session, right-click it and use the **Cancel all running requests** action.

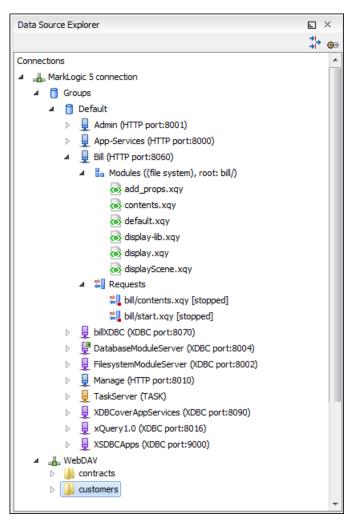

Figure 241: MarkLogic Connection in Data Source Explorer

The **Data Source Explorer** view displays all the application servers available on the MarkLogic server. To change the XDBC application server that Oxygen XML Developer plugin uses to process XQuery expressions, select the **Use it to execute queries** option from its contextual menu.

To manage resources for a MarkLogic database through WebDAV, configure a WebDAV URL in *the MarkLogic connection*.

The following actions are available in the contextual menu of the WebDAV connection:

• Connection level actions:

© Configure Database Sources

Opens the **Data Sources** preferences page. Here you can configure both data sources and connections.

New Folder

Creates a new folder on the server.

Import Files

Allows you to add a new file on the server.

C Refresh

Performs a refresh of the connection.

Find/Replace in Files

Allows you to find and replace text in multiple files from the server.

Folder level actions:

New File

Creates a new file on the server in the current folder.

New Folder

Creates a new folder on the server.

Import Folders

Imports folders on the server.

Import Files

Allows you to add a new file on the server in the current folder.

Removes the current selection and places it in the clipboard.

Copies the current selection into the clipboard.

Rename

Allows you to change the name of the selected folder.

X Delete

Removes the selected folder.

C Refresh

Refreshes the sub-tree of the selected node.

Find/Replace in Files

Allows you to find and replace text in multiple files from the server.

• File level actions:

Open

Allows you to open the selected file in the editor.

Removes the current selection and places it in the clipboard.

Copies the current selection into the clipboard.

Copy Location

Copies an application-specific URL for the selected resource into the clipboard. You can use this URL for various actions, such as opening or transforming the resources.

Rename

Allows you to change the name of the selected file.

× Delete

Removes the selected file.

C Refresh

Performs a refresh of the selected node.

Properties

Displays the properties of the current file in a **Properties** dialog box.

Find/Replace in Files

Allows you to find and replace text in multiple files from the server.

Compare

Compares the resources using Diff Files (this action is available in the contextual menu of two selected resources).

Documentum xDb (X-Hive/DB) Connection

This section explains the actions that are available on a Documentum xDb (X-Hive/DB) 10 connection.

Actions Available at Connection Level

For a Documentum xDb (X-Hive/DB) 10 database, the actions available at connection level in the **Data Source Explorer** view are as follows:

C Refresh

Performs a refresh for the sub-tree of the selected node.

Disconnect

Closes the current database connection.

© Configure Database Sources

Opens the **Data Sources** *preferences page* where you can configure both data sources and connections.

Add library

Allows you to add a new library.

Insert XML Instance

Allows you to add a new XML resource directly into the database root. See *Documentum xDb (X-Hive/DB) 10 Parser Configuration* for more details.

Insert non-XML Instance

Allows you to add a new non-XML resource directly in the database root.

Properties

Displays the connection properties.

Actions Available at Catalog Level

For a Documentum xDb (X-Hive/DB) 10 database, the actions available at catalog level in the **Data Source Explorer** view are as follows:

C Refresh

Performs a refresh of the selected catalog.

Add as models

Allows you to add a new abstract schema model to the selected catalog.

Set default schema

Allows you to set a default DTD to be used for parsing. It is not possible to set a default XML Schema.

Clear default schema

Allows you to clear the default DTD. The action is available only if there is a DTD set as default.

Properties

Displays the catalog properties.

Actions Available at Schema Resource Level

For a Documentum xDb (X-Hive/DB) 10 database, the actions available at schema resource level in the **Data Source Explorer** view are as follows:

C Refresh

Performs a refresh of the selected schema resource.

Dpen 🔁

Opens the selected schema resource in the editor.

Rename

Allows you to change the name of the selected schema resource.

Save As

Allows you to save the selected schema resource as a file on disk.

Delete

Removes the selected schema resource from the catalog.

Copy location

Allows you to copy the URL of the selected schema resource to the clipboard.

Set default schema

Allows you to set the selected DTD to be used as default for parsing. The action is available only for DTD.

Clear default schema

Allows you to unset the selected DTD. The action is available only if the selected DTD is the current default to be used for parsing.

Actions Available at Library Level

For a Documentum xDb (X-Hive/DB) 10 database, the actions available at library level in the **Data Source Explorer** view are as follows:

C Refresh

Performs a refresh of the selected library.

Add library

Adds a new library as a child of the selected library.

Add local catalog

Adds a catalog to the selected library. By default, only the root-library has a catalog, and all models are stored there.

Insert XML Instance

Allows you to add a new XML resource to the selected library. See *Documentum xDb* (X-Hive/DB) 10 Parser Configuration for more details.

Insert non-XML Instance

Allows you to add a new non-XML resource to the selected library.

Rename

Allows you to specify a new name for the selected library.

Move

Allows you to move the selected library to a different one (also available through drag and drop).

X Delete

Removes the selected library.

Properties

Displays the library properties.

Actions Available at Resource Level

When an XML instance document is added for a Documentum xDb (X-Hive/DB) 10 database, the actions available at resource level in the **Data Source Explorer** view are as follows:

C Refresh

Performs a refresh of the selected resource.

Open

Opens the selected resource in the editor.

Rename

Allows you to change the name of the selected resource.

Move

Allows you to move the selected resource into a different library in the database tree (also available through drag and drop).

Note: You can copy or move resources by dragging them from another database catalog.

Save As

Allows you to save the selected binary resource as a file on disk.

X Delete

Removes the selected resource from the library.

Copy location

Allows you to copy the URL of the selected resource to the clipboard.

Add AS model

Allows you to add an XML schema to the selected XML resource.

Set AS model

Allows you to set an active AS model for the selected XML resource.

Clear AS model

Allows you to clear the active AS model of the selected XML resource.

Properties

Displays the resource properties. Available only for XML resources.

Compare

Compares the resources using Diff Files (this action is available in the contextual menu of two selected resources).

Validation of an XML resource stored in an Documentum xDb (X-Hive/DB) 10 database is done against the schema associated with the resource in the database.

Documentum xDb (X-Hive/DB) 10 Parser Configuration for Adding XML Instances

When an XML instance document is added to a Documentum xDb (X-Hive/DB) 10 connection or library, it is parsed with an internal XML parser of the database server. The following options are available for configuring this parser:

- DOM Level 3 parser configuration parameters. More about each parameter can be found here: *DOM Level 3 Configuration*.
- Documentum xDb (X-Hive/DB) 10 specific parser parameters (for more information, consult the Documentum xDb (X-Hive/DB) 10 manual):
 - **xhive-store-schema** If checked, the corresponding DTD or XML schemas are stored in the catalog during validated parsing.
 - **xhive-store-schema-only-internal-subset** Stores only the internal sub-set of the document (not an external sub-set). This option modifies the **xhive-store-schema** (only has a function when that parameter is set to true, and when a DTD is involved). Select this option if you only want to store the internal sub-set of the document (not the external sub-set).
 - **xhive-ignore-catalog** Ignores the corresponding DTD and XML schemas in the catalog during validated parsing.
 - **xhive-psvi** Stores **psvi** information about elements and attributes. Documents parsed with this feature turned on give access to **psvi** information and enable support of data types by XQuery queries.
 - **xhive-sync-features** With this convenience setting turned on, parameter settings of XhiveDocumentIf are synchronized with the parameter settings of LSParser. Note that parameter settings **xhive-psvi** and **schema-location** are always synchronized.

Troubleshooting Documentum xDB

Cannot save the file. DTD factory class org.apache.xerces.impl.dv.dtd.DTDDVFactoryImpl does not extend from DTDDVFactory

I am able to access my XML Database in the Data Source Explorer and open files for reading but when I try to save changes to a file back into the database, I receive the following error: "Cannot save the file. DTD factory class org.apache.xerces.impl.dv.dtd.DTDDVFactoryImpl does not extend from DTDDVFactory." How can I fix this?

Answer:

xhive.jar contains a MANIFEST.MF with a classpath:

```
Class-Path: core/antlr-runtime.jar core/aspectjrt.jar core/fastutil-shrinked.jar core/google-collect.jar core/icu4j.jar core/lucene-regex.jar core/lucene.jar core/serializer.jar core/xalan.jar core/xercesImpl.jar
```

Since the driver was configured to use xhive.jar directly from the xDB installation (where many other jars are located), core/xercesImpl.jar from the xDB installation directory is loaded even though it is not specified in the list of jars from the data source driver configuration (it is in the classpath from xhive.jar's MANIFEST.MF). A simple workaround for this issue is to copy **ONLY** the jar files used in the driver configuration to a separate folder and configure the data source driver to use them from there.

XQuery and Databases

XQuery is a native XML query language that is useful for querying XML views of relational data to create XML results. It also provides the mechanism to efficiently and easily extract information from Native XML Databases (NXD) and relational data. The following database systems supported in Oxygen XML Developer plugin offer XQuery support:

- Native XML Databases:
 - Berkeley DB XML
 - eXist
 - MarkLogic (validation support available starting with version 5)
 - Documentum xDb (X-Hive/DB) 10
- Relational Databases:
 - IBM DB2
 - Microsoft SQL Server (validation support not available)
 - Oracle (validation support not available)

Build Queries with Drag and Drop from the Data Source Explorer View

When a query is edited in the XQuery editor, the XPath expressions can be composed quickly by dragging them from the **Data Source Explorer** view and dropping them into the editor panel.

- 1. Configure the data source to the relational database.
- **2.** *Configure the connection* to the relational database.
- **3.** Browse the connection in the **Data Source Explorer** view, expanded to the table or column that you want to insert in the query.
- **4.** Drag the table or column name to the XQuery editor panel.
- 5. Drop the table or column name where the XPath expression is needed.

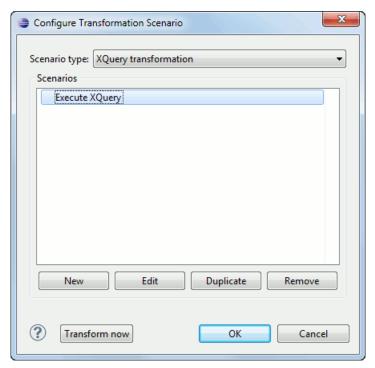

An XPath expression that selects the dragged name is inserted in the XQuery document at the cursor position.

XQuery is designed to retrieve and interpret XML data from any source, whether it is a database or document. Data is stored in relational databases but it is often required that the data be extracted and transformed as XML when interfacing to other components and services. Also, it is an XPath-based querying language supported by most NXD vendors. To perform a query, you need an XQuery transformation scenario.

- **1.** Configure a data source for the database.

 The data source can be *relational* or *XML native*.
- 2. Configure an XQuery transformation scenario.
 - a) Click the Configure Transformation Scenario toolbar button or go to menu Document > Transformation > Configure Transformation Scenario.

The Configure Transformation Scenario dialog box is opened.

b) Click the **New** button in the dialog box.

The dialog box for editing an XQuery scenario is opened.

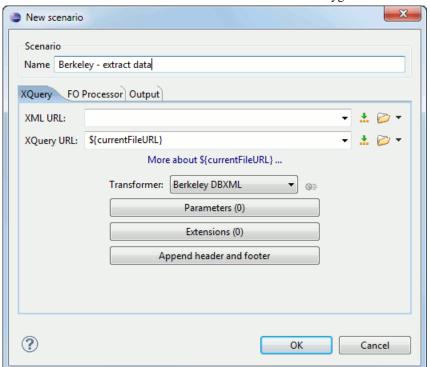

Figure 242: Edit Scenario Dialog Box

- c) Insert the scenario name in the dialog box for editing the scenario.
- d) Choose the database connection in the **Transformer** drop-down list.
- e) Configure any other parameters as needed.

For an XQuery transformation, the output tab has an option called **Sequence** that allows you to run an XQuery in lazy mode. The amount of data extracted from the database is controlled from the option *Size limit on Sequence view*. If you choose **Perform FO Processing** in the **FO Processor** tab, the **Sequence** option is ignored.

f) Click the **OK** button to finish editing the scenario.

Once the scenario is associated with the XQuery file, the query can include calls to specific XQuery functions that are implemented by that engine. The available functions depend on the target database engine selected in the scenario. For example, for eXist and Berkeley DB XML, the Content Completion Assistant lists the functions supported by that database engine. This is useful for only inserting calls to the supported functions (standard XQuery functions or extension ones) into the query.

Note: An XQuery transformation is executed against a Berkeley DB XML server as a transaction using the query transaction support of the server.

3. Run the scenario.

To view a more complex value returned by the query that cannot be entirely displayed in the XQuery query result table at the bottom of the Oxygen XML Developer plugin window (for example, an XMLTYPE or CLOB value), do the following:

- Right-click that table cell.
- Select the Copy cell action from the contextual menu to copy the value into the clipboard.
- Paste the value wherever you need it (for example, in an opened XQuery editor panel of Oxygen XML Developer plugin).

XQuery Database Debugging

This section describes the procedures for debugging XQuery transformations that are executed against MarkLogic and Berkeley DB XML databases.

Debugging with MarkLogic

To start a debug session against the MarkLogic engine, configure a *MarkLogic data source* and a *MarkLogic connection*. Make sure that the debugging support is enabled in the MarkLogic server that Oxygen XML Developer plugin accesses. On the server side, debugging must be activated in the XDBC server and in the *Task Server* section of the server control console (the switch *debug allow*). If the debugging is not activated, the MarkLogic server reports the DBG-TASKDEBUGALLOW error.

The MarkLogic XQuery debugger integrates seamlessly into the *XQuery Debugger perspective*. If you have a MarkLogic scenario configured for the XQuery file, you can choose to *debug the scenario* directly. If not, switch to the XQuery Debugger perspective, open the XQuery file in the editor, and select the MarkLogic connection in the XQuery engine selector from the *debug control toolbar*. For general information about how a debugging session is started and controlled see the *Working with the Debugger* section.

If you want to debug an XQuery file stored on the MarkLogic server, we recommend you to use the **Data Source Explorer** view to open the module and start the debugging session. This improves the resolving of any imported modules.

Before starting a debugging session, we recommend that you link the MarkLogic connection with an Eclipse project. To do this, go to the **Data Source Explorer** view and select **Link to project** in the contextual menu of the MarkLogic connection. The major benefit of linking a debugging session with a project is that you can add breakpoints in the XQuery modules stored on the server. You are also able to access these modules from the Eclipse navigator and run debugging sessions from them.

Oxygen XML Developer plugin supports collaborative debugging. This feature allows multiple users to participate in the same debugging session. You can start a debugging session and at a certain point another user can continue it.

In a MarkLogic debugging session, when you add a breakpoint on a line where the debugger never stops, Oxygen XML Developer plugin displays a warning message. These warnings are displayed for breakpoints you add either in the main XQuery (which you can open locally or from the server), or for breakpoints you add in any XQuery that is opened from the connection that participates in the debugging session.

Remote Debugging with MarkLogic

The HTTP and the XDBC servers involved in the debugging session must have the same modules configuration.

To watch our video demonstration about the XQuery debugger for MarkLogic, go to http://oxygenxml.com/demo/XQueryDebuggerforMarkLogic.html.

Peculiarities and Limitations of the MarkLogic Debugger

MarkLogic debugger has the following peculiarities and limitations:

- Debugging support is available only for MarkLogic server versions 4.0 or newer.
- For MarkLogic server versions 4.0 or newer, there are three XQuery syntaxes that are supported: '0.9-ml' (inherited from MarkLogic 3.2), '1.0-ml', and '1.0'.
- The local debugger user interface presents all the debugging steps that the MarkLogic server executes and the results
 or possible errors of each step.
- All declared variables are presented as strings. The **Value** column of the **Variables** view contains the expression from the variable declaration. It can be evaluated by copying the expression with the **Copy value** action from the contextual menu of *the Variables view* and pasting it in *the XWatch view*.
- There is no support for *Output to Source Mapping*.
- There is no support for *showing the trace*.
- You can set *Breakpoints* in imported modules in one of the following cases:
 - When you open the module from the context of the application server involved in the debugging, using the **data source explorer**.

- When the debugger automatically opens the modules in the Editor.
- No breakpoints are set in modules from the same server that are not involved in the current debugging session.
- No support for profiling when an XQuery transformation is executed in the debugger.

Debugging Queries Which Import Modules

When debugging queries on a MarkLogic database that imports modules stored in the database, the recommended steps for placing a *breakpoint* in a module are as follows:

- 1. Start the debugging session with the action Debug Scenario from the Transformation toolbar or the XQuery Debugger toolbar button.
- 2. Click Step into repeatedly until reaching the desired module.
- 3. Add the module to the current *project* for easy access.
- 4. Set breakpoints in the module as needed.
- **5.** *Continue debugging* the query.

When starting a new debugging session, make sure that the modules that you will debug are already opened in the editor. This is necessary so that the breakpoints in the modules will be considered. Also, make sure that there are no other opened modules that are not involved in the current debugging session.

Debugging with Berkeley DB XML

The Berkeley DB XML database added a debugging interface starting with version 2.5. The current version is supported in the Oxygen XML Developer plugin XQuery Debugger. *The same restrictions and peculiarities* apply for the Berkeley debugger as for the MarkLogic debugger.

WebDAV Connection

This section explains how to work with a WebDAV connection in the Data Source Explorer view.

How to Configure a WebDAV Connection

By default, Oxygen XML Developer plugin is configured to contain a WebDAV data source connection called **WebDAV** (**S)FTP**. Based on this data source, you can create a WebDAV connection for browsing and editing data from a database that provides a WebDAV interface. The connection is available in *the Data Source Explorer view*. The steps for configuring a WebDAV connection are as follows:

- 1. Open the **Preferences** dialog box and go to **Data Sources**.
- 2. In the Connections panel, click the New button.
- **3.** Enter a unique name for the connection.
- **4.** Select one of the WebDAV data sources in the **Data Source** drop-down menu.
- **5.** Enter the connection details:
 - a) Set the URL to the WebDAV repository in the field **WebDAV URL**.
 - b) Set the user name that is used to access the WebDAV repository in the **User** field.
 - c) Set the password that is used to access the WebDAV repository in the **Password** field.
- 6. Click the OK button.

To watch our video demonstration about the WebDAV support in Oxygen XML Developer plugin, go to http://www.oxygenxml.com/demo/WebDAV Support.html.

WebDAV Connection Actions

This section explains the actions that are available for a WebDAV connection in the **Data Source Explorer** view.

Actions Available at Connection Level

The contextual menu of a WebDAV connection in the **Data Source Explorer** view contains the following actions:

© Configure Database Sources

Opens the **Data Sources** preferences page. Here you can configure both data sources and connections.

Disconnect

Stops the connection.

Import Files

Allows you to add a new file on the server.

New Folder

Creates a new folder on the server.

C Refresh

Performs a refresh of the connection.

Find/Replace in Files

Allows you to find and replace text in multiple files from the server.

Actions Available at Folder Level

The contextual menu of a folder node in a WebDAV connection in the **Data Source Explorer** view contains the following actions:

New File

Creates a new file on the server in the current folder.

New Folder

Creates a new folder on the server.

Import Folders

Imports folders on the server.

坐 Import Files

Allows you to add a new file on the server in the current folder.

& Cut

Removes the current selection and places it in the clipboard.

Copy

Copies the current selection into the clipboard.

Paste

Pastes the copied selection.

Rename

Allows you to change the name of the selected folder.

X Delete

Removes the selected folder.

C Refresh

Refreshes the sub-tree of the selected node.

Find/Replace in Files

Allows you to find and replace text in multiple files from the server.

Actions Available at File Level

The contextual menu of a file node in a WebDAV connection in the **Data Source Explorer** view contains the following actions:

■ Open

Allows you to open the selected file in the editor.

从 Cu

Removes the current selection and places it in the clipboard.

Copy

Copies the current selection into the clipboard.

Copy Location

Copies an application-specific URL for the selected resource into the clipboard. You can use this URL for various actions, such as opening or transforming the resources.

Rename

Allows you to change the name of the selected file.

× Delete

Removes the selected file.

C Refresh

Performs a refresh of the selected node.

Properties

Displays the properties of the current file in a **Properties** dialog box.

Find/Replace in Files

Allows you to find and replace text in multiple files from the server.

BaseX Support

This section explains how to configure the BaseX XML database support. The BaseX support is composed of two parts:

- Resource management in the **Data Source Explorer** view.
- · XQuery execution.

Resource Management

Resource management is available by creating a WebDAV connection to the BaseX server.

First of all, make sure the BaseX HTTP Server is started. For details about starting the BaseX HTTP server, go to http://docs.basex.org/wiki/Startup#BaseX_HTTP_Server. The configuration file for the HTTP server is named . basex and is located in the BaseX installation directory. This file helps you to find out the port on which the HTTP server is running. The default port for BaseX WebDAV is 8984.

To ensure that everything is functioning, open a WebDAV URL inside a browser and check to see if it works. For example, the following URL retrieves a document from a database named TEST:

http://localhost:8984/webdav/TEST/etc/factbook.xml.

Once you are sure that the BaseX WebDAV service is working, you can configure the WebDAV connection in Oxygen XML Developer plugin as described in *How to Configure a WebDAV Connection* on page 499. The WebDAV URL should resemble this: http://{hostname }:{port}/webdav/. If the BaseX server is running on your own machine and it has the default configuration, the data required by the WebDAV connection is:

• WebDAV URL: http://localhost:8984/webdav

- User: admin
- Password: admin

Once the WebDAV connection is created, you can start browsing using the **Data Source Explorer** view.

XQuery Execution

XQuery execution is possible through an XQJ connection.

BaseX XQJ Data Source

First of all, create an XQJ data source as described in *How to Configure an XQJ Data Source* on page 424. The BaseX XQJ API-specific files that must be added in the configuration dialog box are xqj-api-1.0.jar, xqj2-0.1.0.jar and basex-xqj-1.2.3.jar (the version names of the JAR file may differ). These libraries can be downloaded from xqj.net/basex/basex-xqj-1.2.3.zip. As an alternative, you can also find the libraries in the BaseX installation directory, in the **lib** sub-directory.

BaseX XQJ Connection

The next step is to create an XQJ connection as described in *How to Configure an XQJ Connection* on page 425.

For a default BaseX configuration, the following connection details apply (you can modify them when necessary):

- Port: 1984
- serverName: localhost
- *user*: admin
- *password*: admin

XQuery Execution

Now that the XQJ connection is configured, open the XQuery file you want to execute in Oxygen XML Developer plugin and create a *Transformation Scenario* as described in *XQuery Transformation* on page 369. In the **Transformer** drop-down menu, select the name of the XQJ connection you created. Apply the transformation scenario and the XQuery will be executed.

Importing Data

Topics:

- Import from Text Files
- Import from MS Excel Files
- Import Database Data as an XML Document
- Import from HTML Files
- Import Content Dynamically

Computer systems and databases contain data in incompatible formats and one of the most time-consuming activities has been to exchange data between these systems. Converting the data to XML can greatly reduce complexity and create data that can be read by different types of applications.

Oxygen XML Developer plugin offers support for importing text files, MS Excel files, Database Data, and HTML files into XML documents. The XML documents can be further converted into other formats using the *Transform features*.

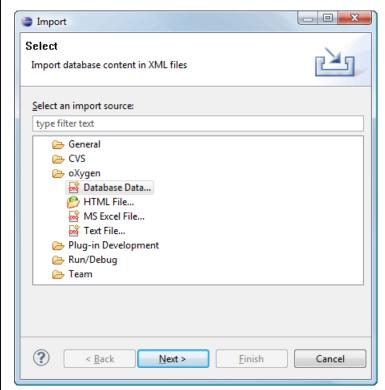

Figure 243: The Import Wizards of the Oxygen XML Developer plugin Plugin

Import from Text Files

To import a text file into an XML file, follow these steps:

- 1. Go to File > Import > Oxygen XML Developer plugin > Text File and click Next. The Select text file dialog box is displayed.
- 2. Select the URL of the text file.
- **3.** Select the encoding of the text file.
- **4.** Click the **Next** button. The **Import from text file** dialog box is displayed.

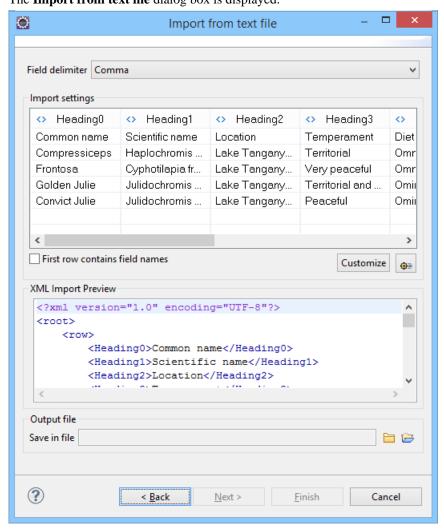

Figure 244: Import from Text File Dialog Box

- **5.** Configure the settings for the conversion.
 - a) Select the **Field delimiter** for the import settings. You can choose between the following: Comma, Semicolon, Tab, Space, or Pipe.
 - b) The **Import settings** section presents the input data in a tabular form. By default, all data items are converted to element content (symbol), but this can be overridden by clicking the individual column headers. Clicking a column header once causes the data from this column to be converted to attribute values (symbol). Clicking a second time causes the column data to be ignored (symbol) when generating the XML file. You can cycle through these three options by continuing to click the column header.

- c) **First row contains field names** If this option is enabled, the default column headers are replaced (where such information is available) by the content of the first row. In other words, the first row is interpreted as containing the field names. The changes are also visible in the preview panel.
- d) **Customize** This button opens a **Presentation Names** dialog box that allows you to edit the name, XML name, and conversion criterion for the root and row elements. The XML names can be edited by double-clicking the desired item and entering the label. The conversion criteria can also be modified by selecting one of the following option in the drop-down menu: ELEMENT, ATTRIBUTE, or SKIPPED.
- e) **Settings** Clicking this button opens the *Import Preferences* on page 591 page that allows you to configure more import options.
- f) The XML Import Preview panel contains an example of what the generated XML document looks like.
- g) Save in file If checked, the new XML document is saved in the specified path.
- **6.** Click **Finish** to generate the XML document.

Import from MS Excel Files

By default, importing Excel 97/2000/XP/2003 formats are supported out-of-the-box. To import spreadsheet data from Excel 2007 or newer, additional libraries are needed before using this procedure. See *Import Data from MS Excel 2007 or Newer* on page 507 for instructions on adding the additional libraries.

Oxygen XML Developer plugin offers support for importing MS Excel Files.

To import an Excel file into an XML file, follow these steps:

- 1. Go to File > Import > Oxygen XML Developer plugin > MS Excel file.
- **2.** Select the URL of the Excel file.

The sheets of the document you are importing are presented in the **Available Sheets** section of this dialog box.

3. Click the **Next** button.

Opens the **Import from Excel** dialog box.

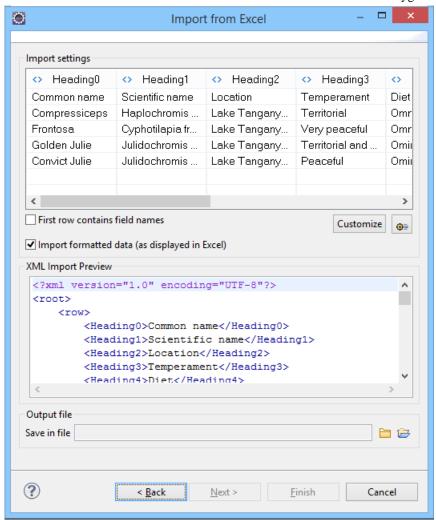

Figure 245: Import from Excel Dialog Box

- **4.** Configure the settings for the conversion.
 - a) The **Import settings** section presents the input data in a tabular form. By default, all data items are converted to element content (symbol), but this can be overridden by clicking the individual column headers. Clicking a column header once causes the data from this column to be converted to attribute values (symbol). Clicking a second time causes the column data to be ignored (symbol) when generating the XML file. You can cycle through these three options by continuing to click the column header.
 - b) **First row contains field names** If this option is enabled, the default column headers are replaced (where such information is available) by the content of the first row. In other words, the first row is interpreted as containing the field names. The changes are also visible in the preview panel.
 - c) **Customize** This button opens a **Presentation Names** dialog box that allows you to edit the name, XML name, and conversion criterion for the root and row elements. The XML names can be edited by double-clicking the desired item and entering the label. The conversion criteria can also be modified by selecting one of the following option in the drop-down menu: ELEMENT, ATTRIBUTE, or SKIPPED.
 - d) **Settings** Clicking this button opens the *Import Preferences* on page 591 page that allows you to configure more import options.
 - e) **Import formatted data (as displayed in Excel)** If this option is selected, the imported data retains the Excel styling. If deselected, the data formatting is not imported.
 - f) The XML Import Preview panel contains an example of what the generated XML document looks like.
 - g) Save in file If checked, the new XML document is saved in the specified path.

5. Click **Finish** to generate the XML document.

Import Data from MS Excel 2007 or Newer

To import spreadsheet data from Excel 2007 or newer (.xlsx), Oxygen XML Developer plugin needs additional libraries from the release 3.10 of the Apache POI project.

To add the additional libraries, follow these steps:

- 1. Download version 3.10 of the Apache POI project from http://archive.apache.org/dist/poi/release/bin/. The specific ZIP file that you need is: poi-bin-3.10-FINAL-20140208.zip.
- 2. Unpack poi-bin-3.10-FINAL-20140208.zip.
- 3. Copy the following .jar files in the plugin.xml file of the Oxygen XML Developer plugin Eclipse plugin (if you installed the plugin via the Eclipse update site, you will find it in the eclipse/plugins/com.oxygenxml... folder, and if you installed it via the dropins ZIP distribution, it is located in the eclipse/dropins/plugins/com.oxygenxml... folder):
 - dom4j-1.6.1.jar
 - poi-ooxml-3.10-FINAL-20140208.jar
 - poi-ooxml-schemas-3.10-FINAL-20140208.jar
 - xmlbeans-2.3.0.jar

Import Database Data as an XML Document

To import the data from a relational database table as an XML document, follow these steps:

1. Go to File > Import > oXygen / Database Data and click Next to start the Import wizard.

This opens a **Select database table** dialog box that lists all the defined database connections:

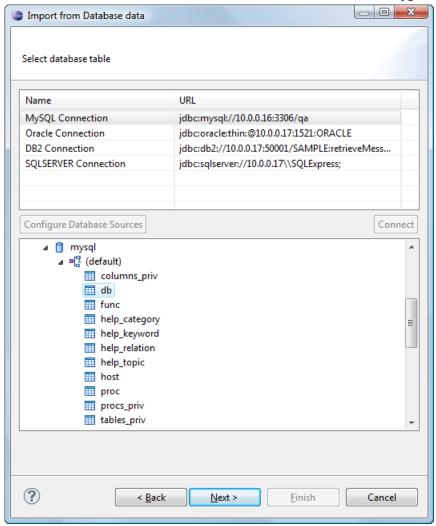

Figure 246: Select Database Table Dialog Box

- 2. Select the connection to the database that contains the appropriate data.

 Only connections configured in relational data sources can be used to import data.
- **3.** If you want to edit, delete, or add a data source or connection, click the **Configure Database Sources** button. The **Preferences/Data Sources** option page is opened.
- 4. Click Connect.
- **5.** In the list of sources, expand a schema and choose the required table.
- 6. Click the **Next** button.

The Import Criteria dialog box is opened with a default query string in the SQL Query pane.

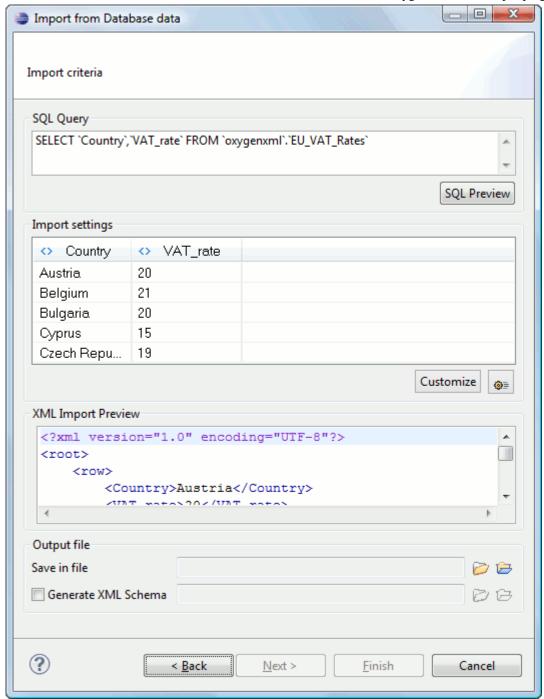

Figure 247: Import from Database Criteria Dialog Box

- **7.** Configure the settings for the conversion.
 - a) SQL Preview If this button is pressed, the Import settings pane displays the labels that are used in the XML document and the first five lines from the database. By default, all data items are converted to element content (symbol), but this can be overridden by clicking the individual column headers. Clicking a column header once causes the data from this column to be converted to attribute values (symbol). Clicking a second time causes the column data to be ignored (symbol) when generating the XML file. You can cycle through these three options by continuing to click the column header.
 - b) **Customize** This button opens a **Presentation Names** dialog box that allows you to edit the name, XML name, and conversion criterion for the root and row elements. The XML names can be edited by double-clicking the

- desired item and entering the label. The conversion criteria can also be modified by selecting one of the following option in the drop-down menu: ELEMENT, ATTRIBUTE, or SKIPPED.
- c) **[Section Settings Clicking this button opens the** *Import Preferences* on page 591 page that allows you to configure more import options.
- d) The XML Import Preview panel contains an example of what the generated XML document looks like.
- e) Save in file If checked, the new XML document is saved in the specified path.
- f) Generate XML Schema Allows you to specify the path of the generated XML Schema file.
- **8.** Click **Finish** to generate the XML document.

Import from HTML Files

Oxygen XML Developer plugin offers support for importing HTML files as an XML document.

To import from HTML files, follow these steps:

- Go to File > Import > Oxygen XML Developer plugin > HTML File. The Import HTML wizard is displayed.
- 2. Select a parent folder and file name for the resulting XHTML document.
- **3.** Enter the URL of the HTML document.
- **4.** Select the type of the resulting XHTML document:
 - XHTML 1.0 Transitional
 - XHTML 1.0 Strict
- 5. Click the **Finish** button.

The resulting document is an XHTML file containing a DOCTYPE declaration that references the XHTML DTD definition on the Web. The parsed content of the imported file is transformed to XHTML Transitional or XHTML Strict depending on the option you chose when performing the import operation.

Import Content Dynamically

Along with the built-in support for various useful URL protocols (such as HTTP or FTP), Oxygen XML Developer plugin also provides special support for a *convert* protocol that can be used to chain predefined processors to import content from various sources dynamically.

A dynamic conversion URL chains various processors that can be applied in sequence on a target resource and has the following general syntax:

```
convert:/processor=xslt;ss=urn:processors:excel2d.xsl/processor=excel!/urn:files:sample.xls
```

The previous example first applies a processor called excel on a target identified by the identifier urn:files:sample.xls and converts the Excel™ resource to XML. The second applied processor (xslt) applies an XSLT stylesheet identified using the identifier urn:processors:excel2d.xsl over the content resulting from the first applied processor. These identifiers are all mapped to real resources on disk via an XML catalog that is configured in the application, as in the following example:

```
<catalog xmlns="urn:oasis:names:tc:entity:xmlns:xml:catalog">
    <rewriteURI uriStartString="urn:files:" rewritePrefix="./resources/"/>
    <rewriteURI uriStartString="urn:processors:" rewritePrefix="./processors/"/>
</catalog>
```

This type of URL can be opened in the application by using the **Open URL** action from the **File** menu. It can also be referenced from existing XML resources via *xi:include* or from *DITA maps* as topic references.

A *GitHub* project that contains various dynamic conversion samples for producing DITA content from various sources (and then publishing it) can be found here: https://github.com/oxygenxml/dita-glass.

Conversion Processors

A set of predefined conversion processors is provided in Oxygen XML Developer plugin out-of-the box. Each processor has its own parameters that can be set to control the behavior of the conversion process. All parameters that are resolved to resources are passed through the XML catalog mapping.

The following predefined conversion processors are included:

• **xslt Processor** - Converts an XML input using XSLT 2.0 processing. The ss parameter indicates the stylesheet resource to be loaded. All other specified parameters will be set as parameters to the XSLT transformation.

```
convert:/processor=xslt;ss=urn:processors:convert.xsl;pl=vl!/urn:files:sample.xml
```

• **xquery Processor** - Converts an XML input using XQuery processing. The ss parameter indicates the XQuery script to be loaded. All other specified parameters will be set as parameters to the XSLT transformation.

```
convert:/processor=xquery;ss=urn:processors:convert.xquery;pl=vl!/urn:files:sample.xml
```

excel Processor - Converts an Excel[™] input to an XML format that can be later converted by other piped processors. It has a single parameter sn, which indicates the name of the sheet that needs to be converted. If this parameter is missing, the XML will contain the combined content of all sheets included in the Excel[™] document.

```
convert:/processor=excel;sn=test!/urn:files:sample.xls
```

• java Processor - Converts an input to another format by applying a specific Java method. The jars parameter is a comma separated list of JAR libraries or folders, from which libraries will be loaded. The con parameter is the fully qualified name of the conversion class that will be instantiated. The conversion class needs to have a method with the following signature:

```
public void convert(String systemID, String originalSourceSystemID, InputStream is,
OutputStream os, LinkedHashMap<String, String> properties) throws IOException

convert:/processor=java;jars=libs;ccn=test.JavaToXML!/
urn:files:java/WSEditorBase.java
```

• **js Processor** - Converts an input to another format by applying a JavaScript method. The js parameter indicates the script that will be used. The fn parameter is the name of the method that will be called from the script. The method must take a string as an argument and return a string. If any of the parameters are missing, an error is thrown and the conversion stops.

```
\verb|convert:/processor=js;js=urn:processors:md.js;fn=convertExternal!/urn:files:sample.md|
```

• **json Processor** - Converts a JSON input to XML. It has no parameters.

```
convert:/processor=json!/urn:files:personal.json
```

• **xhtml Processor** - Converts HTML content to well-formed XHTML. It has no parameters.

```
\verb|convert:/processor=xhtml!/urn:files:test.html|\\
```

• wrap Processor - Wraps content in a tag name making it well-formed XML. The rn parameter indicates the name of the root tag to use. By default, it is wrapper. The encoding parameter specifies the encoding that should be used to read the content. By default, it is UTF8. As an example, this processor can be used if you want to process a comma-separated values file with an XSLT stylesheet to produce XML content. The CSV file is first wrapped as well-formed XML, which is then processed with an xslt processor.

```
convert:/processor=wrap!/urn:files:test.csv
```

Reverse Conversion Processors

All processors defined above can also be used for saving content back to the target resource if they are defined in the URL as reverse processors. Reverse processors are evaluated right to left. These reverse processors allow *round-tripping* content to and from the target resource.

As an example, the following URL converts HTML to DITA when the URL is opened using the h2d.xsl stylesheet and converts DITA to HTML when the content is saved in the application using the d2h.xsl stylesheet.

convert:/processor=xslt;ss=h2d.xsl/rprocessor=xslt;ss=d2h.xsl!/urn:files:sample.html

Important: If you are publishing a DITA map that has such conversion URL references inside, you need to edit the transformation scenario and set the value of the parameter *fix.external.refs.com.oxygenxml* to *true*. This will instruct Oxygen XML Developer plugin to resolve such references during a special pre-processing stage. Depending on the conversion, you may also require additional libraries to be added using the **Libaries** button in the **Advanced** tab of the transformation scenario.

- Integration with Microsoft SharePoint

This chapter explains how you can use Oxygen XML Developer plugin with Documentum CMS and Microsoft SharePoint. .

All the major CMS vendors that are listed in the *CMS Solution Partners section of our website* also provide CMS integration with Oxygen XML Developer plugin.

Integration with Documentum (CMS) (deprecated)

Important: Starting with version 17.0, the support for Documentum (CMS) is deprecated and will no longer be actively maintained.

Oxygen XML Developer plugin provides support for browsing and managing Documentum repositories in the Data Source Explorer. You can easily create new resources on the repository, copy and move them using contextual actions or the drag and drop support, edit and transform the documents in the editor. The operations that can be performed on repository resources are described in the *Documentum (CMS) actions* section.

Oxygen XML Developer plugin supports Documentum (CMS) version 6.5 and 6.6 with *Documentum Foundation Services 6.5 or 6.6* installed.

Attention:

It is recommended to use the latest 1.6.x Java version. It is possible that the Documentum (CMS) support will not work properly if you use other Java versions.

Configure Connection to Documentum Server

This section explains how to configure a connection to a Documentum server.

How to Configure a Documentum (CMS) Data Source

Available in the Enterprise edition only.

To configure a Documentum (CMS) data source you need the Documentum Foundation Services Software Development Kit (*DFS SDK*) corresponding to your server version. The *DFS SDK* can be found in the Documentum (CMS) server installation kit or it can be downloaded from *EMC Community Network*.

Note: The *DFS SDK* can be found in the form of an archive named, for example, *emc-dfs-sdk-6.5.zip* for Documentum (CMS) 6.5.

- 1. Open the **Preferences** dialog box and go to **Data Sources**.
- 2. In the **Data Sources** panel click the **New** button.
- **3.** Enter a unique name for the data source.
- **4.** Select **Documentum** (**CMS**) from the driver type combo box.
- 5. Press the Choose DFS SDK Folder button.
- **6.** Select the folder where you have unpacked the *DFS SDK* archive file.

If you have indicated the correct folder the following Java libraries (jar files) will be added to the list (some variation of the library names is possible in future versions of the *DFS SDK*):

- lib/java/emc-bpm-services-remote.jar
- lib/java/emc-ci-services-remote.jar
- lib/java/emc-collaboration-services-remote.jar
- lib/java/emc-dfs-rt-remote.jar
- lib/java/emc-dfs-services-remote.jar
- lib/java/emc-dfs-tools.jar
- lib/java/emc-search-services-remote.jar
- lib/java/ucf/client/ucf-installer.jar
- lib/java/commons/*.jar (multiple jar files)
- lib/java/jaxws/*.jar (multiple jar files)
- lib/java/utils/*.jar(multiple jar files)

Note: If for some reason the jar files are not found, you can add them manually by using the **Add Files** and **Add Recursively** buttons and navigating to the lib/java folder from the *DFS SDK*.

7. Click the **OK** button to finish the data source configuration.

How to Configure a Documentum (CMS) Connection

Available in the Enterprise edition only.

The steps for configuring a connection to a Documentum (CMS) server are the following:

- 1. Open the Preferences dialog box and go to Data Sources.
- **2.** In the **Connections** panel click the **New** button.
- **3.** Enter a unique name for the connection.
- 4. Select one of the previously configured Documentum (CMS) data sources in the **Data Source** combo box.
- **5.** Fill-in the connection details:
 - URL The URL to the Documentum (CMS) server: http://<hostname>:<port>
 - User The user name to access the Documentum (CMS) repository.
 - Password The password to access the Documentum (CMS) repository.
 - **Repository** The name of the repository to log into.
- **6.** Click the **OK** button to finish the configuration of the connection.

Known Issues

The following are known issues with the Documentum (CMS):

- 1. Note that there is a known problem in the UCF Client implementation for Mac OS X from Documentum 6.5 which prevents you from viewing or editing XML documents from the repository on Mac OS X. The UCF Client is the component responsible for file transfer between the repository and the local machine. This component is deployed automatically from the server. Documentum 6.6 does not exhibit this problem.
 - E,

Note: This issue was reproduced with Documentum 6.5 SP1. In Documentum 6.6 this is no longer reproducing.

2. In order for the Documentum driver to work faster on Linux, you need to specify to the JVM to use a weaker random generator, instead of the very slow native implementation. This can be done by modifying in the Oxygen XML Developer plugin startup scripts (or in the *.vmoptions file) the system property:

-Djava.security.egd=file:/dev/./urandom

Documentum (CMS) Actions in the Data Source Explorer View

Oxygen XML Developer plugin allows you to browse the structure of a Documentum repository in the **Data Source Explorer** view and perform various operations on the repository resources.

You can drag and drop folders and resources to other folders to perform move or copy operations with ease. If the drag and drop is between resources (drag the child item to the parent item) you can create a relationship between the respective resources.

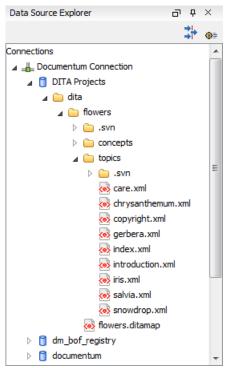

Figure 248: Browsing a Documentum repository

Actions Available on Connection

The contextual menu of a Documentum (CMS) connection in the **Data Source Explorer** view offers the following actions:

Configure Database Sources

Opens the Data Sources preferences page where you can configure both data sources and connections.

New Cabinet

Creates a new cabinet in the repository. The cabinet properties are:

- **Type** The type of the new cabinet (default is **dm_cabinet**).
- Name The name of the new cabinet.
- **Title** The title property of the cabinet.
- **Subject** The subject property of the cabinet.

C Refresh

Refreshes the connection.

Actions Available on Cabinets / Folders

The actions available on a Documentum (CMS) cabinet in the **Data Source Explorer** view are the following:

New Folder

Creates a new folder in the current cabinet / folder. The folder properties are the following:

- **Path** Shows the path where the new folder will be created.
- **Type** The type of the new folder (default is **dm_folder**).
- Name The name of the new folder.
- **Title** The title property of the folder.
- **Subject** The subject property of the folder.

Creates a new document in the current cabinet / folder. The document properties are the following:

- Path Shows the path where the new document will be created.
- Name The name of the new document.
- **Type** The type of the new document (default is **dm_document**).
- Format The document content type format.

Import

Imports local files / folders in the selected cabinet / folder of the repository. Actions available when performing an import:

- Add Files Opens a file browse dialog box and allows you to select files to add to the list.
- Add Folders Opens a folder browse dialog box that allows you to select folders to add to the list. The subfolders
 will be added recursively.
- Edit Opens a dialog box where you can change the properties of the selected file / folder from the list.
- **Remove** Removes the selected files / folders from the list.

Rename

Changes the name of the selected cabinet / folder.

Copy

Copies the selected folder to a different location in the tree (available only upon folders). This action can also be performed with drag and drop while holding the (Ctrl (Meta on Mac OS)) key pressed.

Move

Moves the selected folder to a different location in the tree (available only upon folders). This action can also be performed with drag and drop.

X Delete

Deletes the selected cabinet / folder from the repository. The following options are available:

- Folder(s) Allows you to delete only the selected folder or to delete recursively the folder and all subfolders and objects.
- Version(s) Allows you to specify what versions of the resources will be deleted.
- **Virtual document(s)** Here you can specify what happens when virtual documents are encountered. They can be either deleted either by themselves or together with their descendants.

C Refresh

Performs a refresh of the selected node's sub-tree.

Nroperties 🍄

Displays the list of properties of the selected cabinet / folder.

Actions Available on Resources

The actions available on a Documentum (CMS) resource in the **Data Source Explorer** view are the following:

Edit

Checks out (if not already checked out) and opens the selected resource in the editor.

Edit with

Checks out (if not already checked out) and opens the selected resource in the specified editor / tool.

Open (Read-only)

Opens the selected resource in the editor.

Open with

Opens the selected resource in the specified editor / tool.

Check Out

Checks out the selected resource from the repository. The action is not available if the resource is already checked out.

Check In

Checks in the selected resource (commits changes) into the repository. The action is only available if the resource is checked out.

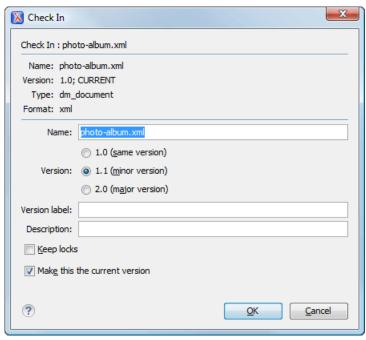

Figure 249: Check In Dialog Box

The following resource properties are available:

- Name The resource name in the repository.
- Version Allows you to choose what version the resource will have after being checked in.
- **Version label** The label of the updated version.
- Description An optional description of the resource.
- Keep Locks When this option is enabled, the updated resource is checked into the repository but it also keeps
 it locked.
- **Make this the current version** Makes the updated resource the current version (will have the *CURRENT* version label).

Cancel Checkout

Cancels the checkout process and loses all modifications since the checkout. Action is only available if the resource is checked out.

Export

Allows you to export the resource and save it locally.

Rename

Changes the name of the selected resource.

Copy

Copies the selected resource in a different location in the tree. Action is not available on virtual document descendants. This action can also be performed with drag and drop while holding the **Ctrl** (**Meta on OS X**) key pressed.

Move

Moves the selected resource in a different location in the tree. Action is not available on virtual document descendants and on checked out resources. This action can also be performed with drag and drop.

X Delete

Deletes the selected resource from the repository. Action is not available on virtual document descendants and on checked out resources.

Add Relationship

Adds a new relationship for the selected resource. This action can also be performed with drag and drop between resources

Convert to Virtual Document

Allows you to convert a simple document to a virtual document. Action is available only if the resource is a simple document.

Convert to Simple Document

Allows you to convert a virtual document to a simple document. Action is available only if the resource is a virtual document with no descendants.

Copy location

Allows you to copy to clipboard an application-specific URL for the resource which can then be used for various actions like opening or transforming the resources.

C Refresh

Performs a refresh of the selected resource.

No Properties

Displays the list of properties of the selected resource.

Transformations on DITA Content from Documentum (CMS)

Oxygen XML Developer plugin comes with the DITA Open Toolkit which is able to transform a DITA map to various output formats. However DITA Open Toolkit requires local DITA files so first you need to check out a local version of your DITA content.

Integration with Microsoft SharePoint

This section explains how to work with a SharePoint connection in the **Data Source Explorer** view.

Note: The SharePoint connection is available in the Enterprise edition.

Note: You can access documents stored on SharePoint Online for Office 365 sites that use as authentication method either *Cloud identity (default)* or *Federated identity (ADFS)*.

To watch our video demonstration about connecting to a repository located on a SharePoint server and using it, go to http://www.oxygenxml.com/demo/SharePoint_Support.html.

How to Configure a SharePoint Connection

By default Oxygen XML Developer plugin contains a predefined **SharePoint** data source. Use this data source to create a connection to a SharePoint server which will be available in *the Data Source Explorer view*.

Follow these steps to configure a SharePoint connection:

- 1. Open the **Preferences** dialog box and go to **Data Sources**.
- **2.** In the **Connections** panel click the **New** button.
- **3.** Enter a unique name for the connection.
- **4.** Select SharePoint in the **Data Source** combo box.
- **5.** Fill-in the connection details:
 - a) Set the URL to the SharePoint repository in the field **SharePoint URL**.

- b) Set the server domain in the **Domain** field.
- c) Set the user name to access the SharePoint repository in the User field.
- d) Set the password to access the SharePoint repository in the **Password** field.

To watch our video demonstration about connecting to repository located on a SharePoint server, go to http://www.oxygenxml.com/demo/SharePoint_Support.html.

SharePoint Connection Actions

This section explains the actions that are available on a SharePoint connection in the **Data Source Explorer** view.

Actions Available at Connection Level

The contextual menu of a SharePoint connection in the **Data Source Explorer** view contains the following actions:

© Configure Database Sources

Opens the **Data Sources** preferences page. Here you can configure both data sources and connections.

Disconnect

Stops the connection.

New Folder

Creates a new folder on the server.

Import Files

Allows you to add a new file on the server.

C Refresh

Performs a refresh of the connection.

Find/Replace in Files

Allows you to find and replace text in multiple files from the server.

Actions Available at Folder Level

The contextual menu of a folder node in a SharePoint connection in the Data Source Explorer view contains the following actions:

New File

Creates a new file on the server in the current folder.

New Folder

Creates a new folder on the server.

Import Folders

Imports folders on the server.

坐 Import Files

Allows you to add a new file on the server in the current folder.

Removes the current selection and places it in the clipboard.

Copies the current selection.

Paste

Pastes the copied selection.

Rename

Allows you to change the name of the selected folder.

Delete

Removes the selected folder.

C Refresh

Refreshes the sub-tree of the selected node.

Find/Replace in Files

Allows you to find and replace text in multiple files from the server.

Actions Available at File Level

The contextual menu of a file node in a SharePoint connection in the **Data Source Explorer** view contains the following actions:

Open

Allows you to open the selected file in the editor.

& Cut

Removes the current selection and places it in the clipboard.

Copy

Copies the current selection into the clipboard.

Copy Location

Copies an application specific URL for the selected resource to the clipboard. You can use this URL for various actions like opening or transforming the resources.

Check Out

Checks out the selected document on the server.

Check In

Checks in the selected document on the server. This action opens the **Check In** dialog box. In this dialog box, the following options are available:

- Minor Version Increments the minor version of the file on the server.
- Major Version Increments the major version of the file on the server.
- Overwrite Overwrites the latest version of the file on the server.
- Comment Allows you to comment on a file that you check in.

Discard Check Out

Discards the previous checkout operation, making the file available for editing to other users.

Rename

Allows you to change the name of the selected file.

X Delete

Removes the selected file.

C Refresh

Performs a refresh of the selected node.

Properties

Displays the properties of the current file in a **Properties** dialog box.

Find/Replace in Files

Allows you to find and replace text in multiple files from the server.

Note: The Check In, Check Out, and Discard Check Out options are available in the Enterprise edition only.

Extension points for Oxygen XML Developer plugin

The Oxygen XML Developer plugin includes a number of extension points, which can be implemented by other Eclipse plugins that depend on it. All of them are listed in the plugin.xml file, along with samples of usage code. The following is a list with short descriptions for some of the most useful extension points:

Tools

Topics:

• XML Digital Signatures

Oxygen XML Developer plugin includes a variety of helpful tools to help you accomplish XML-related tasks. This section presents many of those tools.

XML Digital Signatures

This chapter explains how to apply and verify digital signatures on XML documents.

Digital Signatures Overview

Digital signatures are widely used as security tokens, not just in XML. A digital signature provides a mechanism for assuring integrity of data, the authentication of its signer, and the non-repudiation of the entire signature to an external party:

- A digital signature must provide a way to verify that the data has not been modified or replaced to ensure integrity.
- The signature must provide a way to establish the identity of the data's signer for authentication.
- The signature must provide the ability for the data's integrity and authentication to be provable to a third party for non-repudiation.

A public key system is used to create the digital signature and it's also used for verification. The signature binds the signer to the document because digitally signing a document requires the originator to create a hash of the message and then encrypt that hash value with his own private key. Only the originator has that private key and he is the only one that can encrypt the hash so that it can be unencrypted using his public key. The recipient, upon receiving both the message and the encrypted hash value, can decrypt the hash value, knowing the originator's public key. The recipient must also try to generate the hash value of the message and compare the newly generated hash value with the unencrypted hash value received from the originator. If the hash values are identical, it proves that the originator created the message, because only the actual originator could encrypt the hash value correctly.

XML Signatures can be applied to any digital content (data object), including XML (see W3C Recommendation, *XML-Signature Syntax and Processing*). An XML Signature may be applied to the content of one or more resources:

- · Enveloped or enveloping signatures are applied over data within the same XML document as the signature
- Detached signatures are applied over data external to the signature element; the signature is "detached" from the
 content it signs. This definition typically applies to separate data objects, but it also includes the instance where the
 signature and data object reside within the same XML document but are sibling elements.

The XML Signature is a method of associating a key with referenced data. It does not normatively specify how keys are associated with persons or institutions, nor the meaning of the data being referenced and signed.

The original data is not actually signed. Instead, the signature is applied to the output of a chain of canonicalization and transformation algorithms, which are applied to the data in a designated sequence. This system provides the flexibility to accommodate whatever "normalization" or desired preprocessing of the data that might be required or desired before subjecting it to being signed.

To canonicalize something means to put it in a standard format that everyone generally uses. Since the signature is dependent on the content it is signing, a signature produced from a non-canonicalized document could possibly be different from one produced from a canonicalized document. The canonical form of an XML document is physical representation of the document produced by the method described in this specification. The term canonical XML refers to XML that is in canonical form. The XML canonicalization method is the algorithm defined by this specification that generates the canonical form of a given XML document or document subset. The term XML canonicalization refers to the process of applying the XML canonicalization method to an XML document or document subset. XML canonicalization is designed to be useful to applications that require the ability to test whether the information content of a document or document subset has been changed. This is done by comparing the canonical form of the original document before application processing with the canonical form of the document result of the application processing.

A digital signature over the canonical form of an XML document or document subset would allows the signature digest calculations to be oblivious to changes in the original document's physical representation. During signature generation, the digest is computed over the canonical form of the document. The document is then transferred to the relying party, which validates the signature by reading the document and computing a digest of the canonical form of the received document. The equivalence of the digests computed by the signing and relying parties (and hence the equivalence of the canonical forms over which they were computed) ensures that the information content of the document has not been altered since it was signed.

The following canonicalization algorithms are used in Oxygen XML Developer plugin: Canonical XML (or Inclusive XML Canonicalization)(*XMLC14N*) and Exclusive XML Canonicalization(*EXCC14N*). The first is used for XML where the context doesn't change while the second was designed for canonicalization where the context might change.

Inclusive Canonicalization copies all the declarations, even if they are defined outside of the scope of the signature, and all the declarations you might use will be unambiguously specified. Inclusive Canonicalization is useful when it is less likely that the signed data will be inserted in other XML document and it is the safer method from the security perspective because it requires no knowledge of the data that are to be secured in order to safely sign them. A problem may occur if the signed document is moved into another XML document that has other declarations because the Inclusive Canonicalization will copy them and the signature will be invalid.

Exclusive Canonicalization just copies the namespaces you are actually using (the ones that are a part of the XML syntax). It does not look into attribute values or element content, so the namespace declarations required to process these are not copied. This is useful if you have a signed XML document that you want to insert into other XML documents (or you need self-signed structures that support placement within different XML contexts), as it will ensure the signature is verified correctly each time.

The canonicalization method can specify whether or not comments should be included in the canonical form output by the XML canonicalization method. If a canonical form contains comments corresponding to the comment nodes in the input node-set, the result is called canonical XML with comments. In an uncommented canonical form comments are removed, including delimiter for comments outside document element.

The three operations. Canonicalize, Sign, and Verify Signature, are available from the Source submenu when invoking the contextual menu in **Text** mode or from the **XML Tools** menu.

Canonicalizing Files

You can select the canonicalization algorithm to be used for a document from the dialog box that is displayed by using the **Canonicalize** action that is available from the **Source** submenu when invoking the contextual menu in **Text** mode or from the **XML Tools** menu.

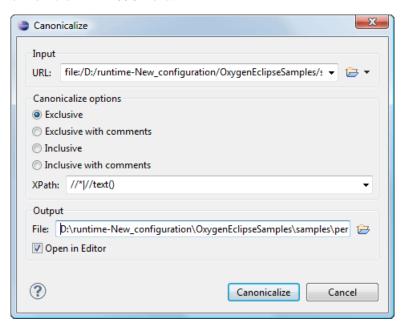

Figure 250: Canonicalization Settings Dialog Box

You can set the following:

- Input URL Available if the Canonicalize action was selected from the XML Tools menu. It allows you to specify
 the location of the input file.
- Exclusive If selected, the exclusive (uncommented) canonicalization method is used.

Note: Exclusive Canonicalization just copies the namespaces you are actually using (the ones that are a part of the XML syntax). It does not look into attribute values or element content, so the namespace declarations required to process these are not copied. This is useful if you have a signed XML document that you want to insert into other XML documents (or you need self-signed structures that support placement within different XML contexts), as it will ensure the signature is verified correctly each time.

- Exclusive with comments If selected, the exclusive with comments canonicalization method is used.
- Inclusive If selected, the inclusive (uncommented) canonicalization method is used.

Note: Inclusive Canonicalization copies all the declarations, even if they are defined outside of the scope of the signature, and all the declarations you might use will be unambiguously specified. Inclusive Canonicalization is useful when it is less likely that the signed data will be inserted in other XML document and it is the safer method from the security perspective because it requires no knowledge of the data that are to be secured in order to safely sign them. A problem may occur if the signed document is moved into another XML document that has other declarations because the Inclusive Canonicalization will copy them and the signature will be invalid.

- Inclusive with comments If selected, the inclusive with comments canonicalization method is used.
- XPath The XPath expression provides the fragments of the XML document to be signed.
- **Output** Available if the **Canonicalize** action was selected from the **XML Tools** menu. It allows you to specify the output file path where the signed XML document will be saved.
- **Open in editor** If checked, the output file will be opened in the editor.

Certificates

A certificate is a digitally signed statement from the issuer (an individual, an organization, a website or a firm), saying that the public key (and some other information) of some other entity has a particular value. When data is digitally signed, the signature can be verified to check the data integrity and authenticity. Integrity means that the data has not been modified. Authenticity means the data comes indeed from the entity that claims to have created and signed it. Certificates are kept in special repositories called *keystores*.

A *keystore* is an encrypted file that contains private keys and certificates. All *keystore* entries (key and trusted certificate entries) are accessed via unique aliases. An alias must be assigned for every new entry of either a key or certificate as a reference for that entity. No *keystore* can store an entity if its alias already exists in that *keystore* and cannot store trusted certificates generated with keys in its *keystore*.

In Oxygen XML Developer plugin there are provided two types of *keystores*: Java Key Store (JKS) and Public-Key Cryptography Standards version 12 (PKCS-12). A *keystore* file is protected by a password. In a PKCS 12 *keystore* you should not store a certificate without alias together with other certificates, with or without alias, as in such a case the certificate without alias cannot be extracted from the *keystore*.

To configure the options for a certificate or to validate it, *open the Preferences dialog box* and go to XML > XML Signing Certificates. This opens *the certificates preferences page*.

Signing Files

You can select the type of signature to be used for documents from a signature settings dialog box. To open this dialog box, select the **Sign** action from the **Source** submenu when invoking the contextual menu in **Text** mode or from the **XML Tools** menu.

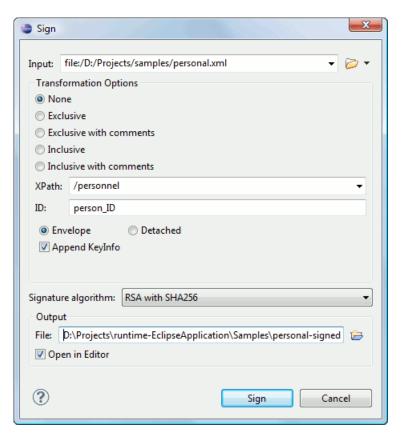

Figure 251: Signature Settings Dialog Box

The following options are available:

Note: If Oxygen XML Developer plugin could not find a valid certificate, a link is provided at the top of the dialog box that opens the *XML Signing Certificates preferences page* where you can configure a valid certificate.

- Input Available if the Sign action was selected from the XML Tools menu. Specifies the location of the input URL
- Transformation Options See the *Digital Signature Overview* section for more information about these options.
 - None If selected, no canonicalization algorithm is used.
 - Exclusive If selected, the exclusive (uncommented) canonicalization method is used.

Note: Exclusive Canonicalization just copies the namespaces you are actually using (the ones that are a part of the XML syntax). It does not look into attribute values or element content, so the namespace declarations required to process these are not copied. This is useful if you have a signed XML document that you want to insert into other XML documents (or you need self-signed structures that support placement within different XML contexts), as it will ensure the signature is verified correctly each time.

- Exclusive with comments If selected, the exclusive with comments canonicalization method is used.
- Inclusive If selected, the inclusive (uncommented) canonicalization method is used.

Note: Inclusive Canonicalization copies all the declarations, even if they are defined outside of the scope of the signature, and all the declarations you might use will be unambiguously specified. Inclusive Canonicalization is useful when it is less likely that the signed data will be inserted in other XML document and it is the safer method from the security perspective because it requires no knowledge of the data that are to be secured in order to safely sign them. A problem may occur if the signed document is moved

into another XML document that has other declarations because the Inclusive Canonicalization will copy them and the signature will be invalid.

- Inclusive with comments If selected, the inclusive with comments canonicalization method is used.
- **XPath** The XPath expression provides the fragments of the XML document to be signed.
- **ID** Provides ID of the XML element to be signed.
- Envelope If selected, the *enveloped* signature is used. See the *Digital Signature Overview* for more information.
- **Detached** If selected, the *detached* signature is used. See the *Digital Signature Overview* for more information.
- Append KeyInfo If this option is checked, the ds: KeyInfo element will be added in the signed document.
- Signature algorithm The algorithm used for signing the document. The following options are available: RSA with SHA1, RSA with SHA256, RSA with SHA384, and RSA with SHA512.
- Output Available if the Sign action was selected from the XML Tools menu. Specifies the path of the output file
 where the signed XML document will be saved.
- Open in editor If checked, the output file will be opened in Oxygen XML Developer plugin.

Verifying the Signature

You can verify the signature of a file by selecting the **Verify Signature** action from the **Source** submenu when invoking the contextual menu in **Text** mode or from the **XML Tools** menu. The **Verify Signature** dialog box then allows you to specify the location of the file whose signature is verified.

If the signature is valid, a dialog box displays the name of the signer. Otherwise, an error shows details about the problem.

Example of How to Digitally Sign XML Files or Content

Suppose you want to digitally sign an XML document, but more specifically, suppose you have multiple instances of the same element in the document and you just want to sign a specific ID. Oxygen XML Developer plugin includes a signature tool that allows you to digitally sign XML documents or specific content.

The Oxygen XML Developer plugin installation directory includes a samples folder that contains a file called personal.xml. For the purposes of this example, this file will be used to demonstrate how to digitally sign specific content. Notice that this file has multiple person elements inside the personnel element. Suppose you want to digitally sign the specific person element that contains the id=robert.taylor. To do this, follow this procedure:

- 1. Open the personal.xml file in Oxygen XML Developer plugin in **Text** editing mode.
- 2. Right-click anywhere in the editor and select the **Sign** action from the **Source** submenu. The **Sign** dialog box is displayed.
 - **Tip:** If you want to sign a file but create a new output file so that the original file remains unchanged, use the **Sign** action from the **XML Tools** menu. Selecting the action from this menu will allow you to choose an input file and output file in the **Sign** dialog box.
- 3. If Oxygen XML Developer plugin cannot find a valid certificate, click the link at the top of the dialog box to configure a valid certificate. This opens the XML Signing Certificates preferences page that allows you to configure and validate a certificate.
- **4.** Once a valid certificate is recognized, continue to configure the **Sign** dialog box.
 - a) Select one of *the Transformation Options*. For the purposes of this example, select the **Inclusive with comments** option.
 - b) Specify the appropriate **XPath** expression for the specific element that needs to be signed. For this example, type /personnel/person in the **XPath** text box.
 - c) Enter the specific **ID** that needs to be signed. For this example, type robert.taylor in the **ID** field.
 - d) Select the **Envelope** option and leave the other options as their default values.

The digital signature is added at the end of the XML document, just before the end tag. It is always added at the end of the document, even if you only sign specific content within the document.

Configuring Oxygen XML Developer plugin

Topics:

- Preferences
- Configuring Options
- Importing / Exporting Global Options
- Reset Global Options
- Scenarios Management
- Editor Variables
- Localizing of the User Interface

This chapter presents all the user preferences and options that allow you to configure various features, or the application itself, and the editor variables that are available for customizing the user-defined commands.

You can configure Oxygen XML Developer plugin options using the **Preferences** dialog box.

To open the preferences dialog box, go to go to **Window** (**Eclipse** on Mac OSX) and choose **Preferences** > **Oxygen XML Developer plugin**.

You can restore options to their default values by pressing the **Restore Defaults** button, available in each preferences page.

Press ? or F1 for help on any preferences page.

A limited version of the **Preferences** dialog box is available by selecting • Options from the contextual menu in the editor.

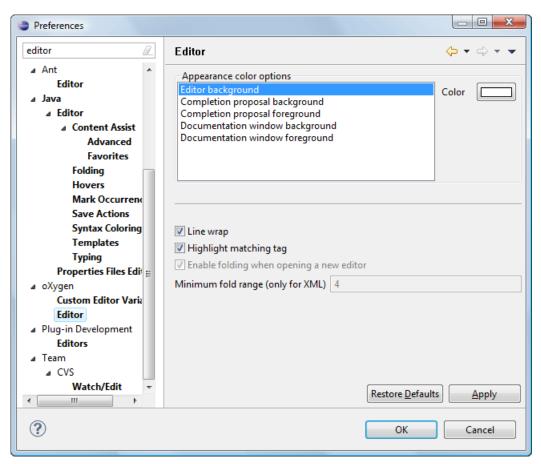

Figure 252: Eclipse Preferences Dialog Box - Restricted Version

Preferences Directory Location

A variety of resources (such as global options, license information, and history files) are stored in a preferences directory (com.oxygenxml) that is in the following locations:

- Windows (Vista, 7, 8, 10) [user_home_directory] \AppData\Roaming\com.oxygenxml
- Windows XP [user_home_directory]\Application Data\com.oxygenxml
- Mac OS X [user_home_directory]/Library/Preferences/com.oxygenxml
- Linux/Unix [user_home_directory] / .com.oxygenxml

Oxygen XML Developer plugin License

To configure the license options, *open the Preferences dialog box*. This preferences page presents the details of the license key that enables the Oxygen XML Developer plugin plugin, such as registration name, category and number of purchased licenses, encrypted signature of the license key. Clicking the **Register** button opens the Oxygen XML Developer plugin **License** dialog box that allows you to insert a new license key.

Archive Preferences

To configure **Archive** preferences, open the **Preferences** dialog box and go to **Archive**.

The following options are available in the **Archive** preferences panel:

- **Archive backup options** Controls if the application makes backup copies of the modified archives. The following options are available:
 - Always create backup copies of modified archives When you modify an archive, its content is backed up.
 - Never create backup copies of modified archives No backup copy is created.
 - Ask for each archive once per session Once per application session for each modified archive, user confirmation is required to create the backup. This is the default setting.

Note: Backup files have the name originalArchiveFileName.bak and are located in the same folder as the original archive.

- Show archive backup dialog box Select this option if you want to be notified for backup when modifying in archives. The last backup option you chose will always be used as the default one.
- Archive types This table contains all known archive extensions mapped to known archive formats. Each row maps
 a list of extensions to an archive type supported in Oxygen XML Developer plugin. You can edit an existing mapping
 or create a new one by associating your own list of extensions to an archive format.
 - Important: You have to restart Oxygen XML Developer plugin after removing an extension from the table in order for that extension to not be recognised anymore as an archive extension.
- Store Unicode file names in Zip archives Use this option when you archive files that contain international (that is, non-English) characters in file names or file comments. If this option is selected and an archive is modified in any way, UTF-8 characters are used in the names of all files in the archive.

CSS Validator Preferences

To configure the CSS Validator preferences, open the Preferences dialog box and go to CSS Validator.

You can configure the following options for the built-in CSS Validator of Oxygen XML Developer plugin:

- Profile Selects one of the available validation profiles: CSS 1, CSS 2, CSS 2.1, CSS 3, CSS 3 with Oxygen extensions, SVG, SVG Basic, SVG Tiny, Mobile, TV Profile, ATSC TV Profile. The CSS 3 with Oxygen extensions profile includes all the CSS 3 standard properties and the CSS extensions specific for Oxygen. That means all Oxygen specific extensions are accepted in a CSS stylesheet by the built-in CSS validator when this profile is selected.
- Media type Selects one of the available mediums: all, aural, braille, embossed, handheld, print, projection, screen, tty, tv, presentation, oxygen.
- Warning level Sets the minimum severity level for reported validation warnings. Can be one of: All, Normal, Most Important, No Warnings.
- **Ignore properties** You can type comma separated patterns that match the names of CSS properties that will be ignored at validation. As wildcards you can use:
 - * to match any string.
 - ? to match any character.

- Recognize browser CSS extensions (applies also to content completion) If checked, Oxygen XML Developer plugin recognizes (no validation is performed) browser-specific CSS properties. The Content Completion Assistant lists these properties at the end of its list, prefixed with the following particles:
 - -moz- for Mozilla.
 - -ms- for Internet Explorer.
 - -o- for Opera.
 - -webkit- for Safari/Webkit.

Custom Editor Variables Preferences

An editor variable is useful for making a transformation scenario, a validation scenario or an external tool independent of the file path on which the scenario / command line is applied. An editor variable is specified as a parameter in a transformation scenario, validation scenario or command line of an external tool. Such a variable is defined by a name, a string value and a text description. A custom editor variable is defined by the user and can be used in the same expressions as the built-in ones.

Data Sources Preferences

To configure the **Data Sources** preferences, open the **Preferences** dialog box and go to **Data Sources**.

Data Sources Preferences

To configure the **Data Sources** preferences, *open the Preferences dialog box* and go to **Data Sources**. In this preferences page you can configure data sources and connections to relational databases as well as native XML databases. You can check the list of drivers available for the major database servers here: http://www.oxygenxml.com/database_drivers.html.

Connection Wizards Section

Create eXist-db XML connection

Click this link to open the dedicated *Create eXist-db XML connection dialog box* that provides a quick way to create an eXist connection.

Data Sources Section

This section allows you to add and configure data sources.

Figure 254: The Data Sources Preferences Panel

The following buttons are available at the bottom of the **Data Sources** panel:

+ New

Opens the Data Sources Drivers dialog box that allows you to configure a new database driver.

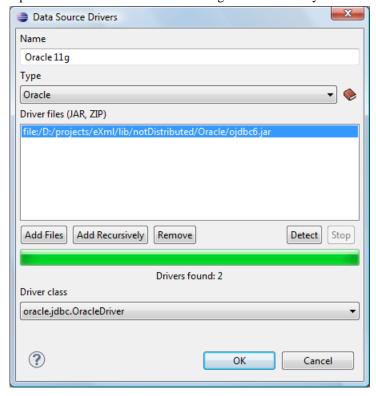

Figure 255: The Data Sources Drivers Dialog Box

The following options are available in the Data Source Drivers dialog box:

- Name The name of the new data source driver that will be used for creating connections to the database.
- **Type** Selects the data source type from the supported driver types.
 - **Help button** Opens the User Manual at *the list of the sections* where the configuration of supported data sources is explained and the URLs for downloading the database drivers are specified.
- **Driver files (JAR, ZIP)** Lists *download links for database drivers* that are necessary for accessing databases in Oxygen XML Developer plugin.
- Add Files Adds the driver class library.
- Add Recursively Adds driver files recursively.
- **Remove** Removes the selected driver class library from the list.

- Detect Detects driver file candidates.
- Stop Stops the detection of the driver candidates.
- **Driver class** Specifies the driver class for the data source driver.

Edit

Opens the **Data Sources Drivers** dialog box for editing the selected driver. See above the specifications for the **Data Sources Drivers** dialog box. In order to edit a data source, there must be no connections using that data source driver.

Creates a copy of the selected data source.

× Delete

Deletes the selected driver. In order to delete a data source, there must be no connections using that data source driver.

Connections Section

This section allows you to add and configure data source connections.

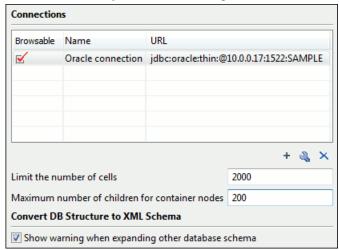

Figure 256: The Connections Preferences Panel

The following buttons are available at the bottom of the **Connections** panel:

+ New

Opens the Connection dialog box that allows you to configure a new database connection.

Figure 257: The Connection Dialog Box

The following options are available in the **Connection** dialog box:

- Name The name of the new connection that will be used in transformation scenarios and validation scenarios.
- Data Source Allows selecting a data source defined in the Data Source Drivers dialog box.

Depending upon the selected data source, you can set some of the following parameters in the **Connection details** area:

- URL The URL for connecting to the database server.
- User The user name for connecting to the database server.
- Password The password of the specified user name.
- **Host** The host address of the server.
- **Port** The port where the server accepts the connection.
- XML DB URI The database URI.
- **Database** The initial database name.
- Collection One of the available collections for the specified data source.
- Environment home directory Specifies the home directory (only for a Berkeley database).
- Verbosity Sets the verbosity level for output messages (only for a Berkeley database).
- Use a secure HTTPS connection (SSL) Allows you to establish a secure connection to an eXist database through the SSL protocol.

🌯 Edit

Opens the **Connection** dialog box, allowing you to edit the selected connection. See above the specifications for the **Connection** dialog box.

Duplicate

Creates a copy of the selected connection.

× Delete

Deletes the selected connection.

1 Move Up

Moves the selected connection up one row in the list.

Moves the selected connection down one row in the list.

Limit the number of cells

For performance issues, you can set the maximum number of cells that will be displayed in the **Table Explorer** view for a database table. Leave this field empty if you want the entire content of the table to be displayed. By default, this field is set to 2000. If a table that has more cells than the value set here is displayed in the **Table Explorer** view, a warning dialog box will inform you that the table is only partially shown.

Maximum number of children for container nodes

In Oracle XML, a container can hold millions of resources. If the node corresponding to such a container in the **Data Source Explorer** view would display all the contained resources at the same time, the performance of the view would be very slow. To prevent this, only a limited number of the contained resources is displayed as child nodes of the container node. Navigation to other contained resources from the same container is enabled by the *Up* and *Down* buttons in the **Data Source Explorer** view. This limited number is set in the field. The default value is 200 nodes.

Show warning when expanding other database schema

Controls if a warning message will be displayed when expanding another database schema and there are tables selected in the current expanded one. This applies to the **Select database table** dialog box in the **Import Database Data** wizard and the **Select database table** section of the **Convert DB Structure to XML Schema** dialog box.

Download Links for Database Drivers

Below you can find instructions for getting the drivers that are necessary to access databases in Oxygen XML Developer plugin.

- **Berkeley DB XML database** Copy the *jar* files from the Berkeley database install directory into the Oxygen XML Developer plugin install directory as described in *the procedure for configuring a Berkeley DB data source*.
- IBM DB2 Pure XML database Go to the IBM website and in the DB2 Clients and Development Tools category select the DB2 Driver for JDBC and SQLJ download link. Fill out the download form and download the zip file. Unzip the zip file and use the db2jcc.jar and db2jcc_license_cu.jar files in Oxygen XML Developer plugin for configuring a DB2 data source.
- **eXist database** Copy the *jar* files from the eXist database install directory to the Oxygen XML Developer plugin install directory as described in *the procedure for configuring an eXist data source*.
- MarkLogic database Download the MarkLogic driver from MarkLogic Community site.
- **Microsoft SQL Server 2005 / 2008 database** Download the appropriate MS SQL JDBC driver from the Microsoft website. For SQL Server 2008 R2 and older go to http://www.microsoft.com/en-us/download/details.aspx?id=21599. For SQL Server 2012 and 2014 go to http://www.microsoft.com/en-us/download/details.aspx?id=11774.
- Oracle 11g database Go to the *Oracle website* and download the Oracle 11g JDBC driver called ojdbc6.jar.
- **PostgreSQL 8.3 database** Go to the *PostgreSQL website* and download the PostgreSQL 8.3 JDBC driver called postgresql-8.3-603.jdbc3.jar.
- **Documentum xDb** (X-Hive/DB) 10 XML database Copy the *jar* files from the Documentum xDb (X-Hive/DB) 10 database install directory to the Oxygen XML Developer plugin install directory as described in *the procedure* for configuring a Documentum xDb (X-Hive/DB) 10 data source.

Table Filters Preferences

to configure the Table Filters preferences, open the Preferences dialog box and go to Data Sources > Table Filters.

Here you can choose which of the database table types will be displayed in the **Data Source Explorer** view.

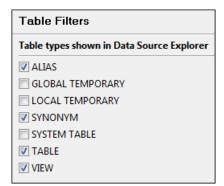

Figure 258: Table Filters Preferences Panel

DITA Preferences

To access the DITA Preferences page, *open the Preferences dialog box* and go to **DITA**. This preferences page includes the following sections and options:

DITA Open Toolkit Section

This section allows you to specify the default directory of the DITA Open Toolkit distribution (bundled with the Oxygen XML Developer plugin installation) to be used for validating and publishing DITA content. You can select from the following:

- **Built-in DITA-OT 1.8** This is the default setting and the default DITA OT directory is: [OXYGEN_DIR]/frameworks/dita/DITA-OT.
- Built-in DITA-OT 2.x (with experimental DITA 1.3 support) All defined DITA transformation scenarios will run with DITA-OT 2.x. This also gives you access to new DITA 1.3 file templates when you *create new documents from templates*. The default DITA OT directory is: [OXYGEN_DIR]/frameworks/dita/DITA-OT2.x.
- **Custom** In the **Location** field, you can either provide a new file path for the specific DITA OT that you want to use or you can select a previously used one from the drop-down list.

The **Show console output** option allows you to specify when to display the console output log. The following options are available:

- When build fails displays the console output log if the build fails.
- Always displays the console output log, regardless of whether or not the build fails.

The following options are available for the Insert Reference and Edit Properties operations:

- Always fill values for attributes Allows you to specify that in the Insert Reference\Edit Properties dialog box,
 the values for these attributes will be automatically populated with a detected value (based on the specifications),
 even if it is the same as the default value.
 - **Format** If enabled, the *Format* attribute will always be populated automatically .
 - **Scope** If enabled, the *Scope* attribute will always be populated automatically.
 - **Type** If enabled, the *Type* attribute will always be populated automatically.

Document Type Association Preferences

Oxygen XML Developer plugin uses document type associations to associate a *document type* with a set of functionality provided by a framework. To configure the **Document Type Association** options, *open the Preferences dialog box* and go to **Document Type Association**.

The following actions are available in this preferences page:

Discover more frameworks by using add-ons update sites

Click on this link to specify URLs for framework add-on update sites.

This table presents the currently defined document type associations (frameworks), sorted by priority and alphabetically. Each edited document type has a set of association rules (used by the application to detect the proper document type association to use for an opened XML document). A rule is described by:

- Namespace Specifies the namespace of the root element from the association rules set (* (any) by default). If
 you want to apply the rule only when the root element has no namespace, leave this field empty (remove the
 ANY_VALUE string).
- Root local name Specifies the local name of the root element (* (any) by default).
- **File name** Specifies the name of the file (* (any) by default).
- **Public ID** Represents the Public ID of the matched document.
- Java class Presents the name of the Java class, which is used to determine if a document matches the rule.

New

Opens a *Document type configuration dialog box* that allows you to add a new association.

Edit

Opens a **Document type** configuration dialog box that allows you to edit an existing association.

Note: If you try to edit an existing association type when you do not have write permissions to its store location, a dialog box will be shown asking if you want to extend the document type.

Duplicate

Opens a *Document type configuration dialog box* that allows you to duplicate the configuration of an existing document type association.

Extend

Opens a *Document type configuration dialog box* that allows you to extend an existing document type. You can add or remove functionality starting from a base document type. All of these changes will be saved as a patch. When the base document type is modified and evolves (for example, from one application version to another) the extension will evolve along with the base document type, allowing it to use the new actions added in the base document type.

Delete

Deletes the selected document type associations.

Enable DTD/XML Schema processing in document type detection

When this option is enabled (default value), the matching process also examines the DTD/XML Schema associated with the document. For example, the fixed attributes declared in the DTD for the root element are also analyzed, if this is specified in the association rules. This is especially useful if you are writing DITA customizations. DITA topics and maps are also matched by looking for the DITAArchVersion attribute of the root element. This attribute is specified as default in the DTD and it is detected in the root element, helping Oxygen XML Developer plugin to correctly match the DITA customization.

Only for local DTDs/XML Schemas

When this option is enabled (default value), only the local DTDs / XML Schemas will be processed.

Enable DTD/XML Schema caching

When this option is enabled (default value), the associated DTDs or XML Schema are cached when parsed for the first time, improving performance when opening new documents with similar schema associations.

Locations Preferences

Oxygen XML Developer plugin allows you to change the location where *document types* (*frameworks*) are stored, and to specify additional framework directories. The **Locations** preferences page allows you to specify the main frameworks folder location. You can choose between the **Default** directory ([OXYGEN_DIR]/frameworks) or a **Custom** specified directory. You can also change the current frameworks folder location value using the com.oxygenxml.editor.frameworks.url system property.

A list of additional frameworks directories can also be specified. The application will look in each of those folders for additional document type configurations to load. Use the **Add**, **Edit** and **Delete** buttons to manage the list of folders.

A document type (configuration) can be loaded from the following locations:

- Internal preferences The document type configuration is stored in the application Internal preferences.
- Additional frameworks directories The document type configuration is loaded from one of the specified Additional frameworks directories list.
- The frameworks folder The main folder containing framework configurations.

All loaded document type configurations are first sorted by priority, then by document type name and then by load location (in the exact order specified above). When an XML document is opened, the application chooses the first document type configuration from the sorted list which matches the specific document.

All loaded document type configurations are first sorted by priority, then by document type.

The Document Type Configuration Dialog Box

The **Document type** configuration dialog box allows you to create or edit a *Document Type Association* (framework). The following fields are available in this dialog box:

- Name The name of the *Document Type Association*.
- **Storage** Displays the type of location where the framework configuration file is stored. Can be one of: **External** (framework configuration is saved in a file) or **Internal** (framework configuration is stored in the application's internal options).

Note: If you set the **Storage** to **Internal** and the document type association settings are already stored in a framework file, the file content is saved in the application's internal options and the file is removed.

- **Description** A detailed description of the framework.
- Priority Depending on the priority level, Oxygen XML Developer plugin establishes the order in which the existing
 document type associations are evaluated to determine the type of a document you are opening. It can be one of the
 following: Lowest, Low, Normal, High, or Highest. You can set a higher priority to *Document Type Associations*you want to be evaluated first.
- Initial edit mode Sets the default edit mode when you open a document for the first time.

You are able to configure the options of each *framework* in the following tabs:

- Association rules
- Schema
- Classpath
- Author
- Templates
- Catalogs
- Transformation
- Validation
- Extensions

The Association Rules Tab

By combining multiple association rules you can instruct Oxygen XML Developer plugin to identify the type of a document. An Oxygen XML Developer plugin association rule holds information about Namespace, Root local name, File name, Public ID, Attribute, and Java class. Oxygen XML Developer plugin identifies the type of a document when the document matches at least one of the association rules. Using the **Document type rule** dialog box, you can create association rules that activate on any document matching all the criteria in the dialog box.

In the **Association rules** tab you can perform the following actions:

Opens the **Document type rule** dialog box allowing you to create association rules.

Opens the **Document type rule** dialog box allowing you to edit the properties of the currently selected association rule

X Delete

Deletes the currently selected association rules.

☆ Move Up

Moves the selection to the previous association rule.

Move Down

Moves the selection to the following association rule.

The Schema Tab

In the **Schema** tab, you can specify a schema that Oxygen XML Developer plugin uses if an XML document does not contain a schema declaration and no default validation scenario is associated with it.

To set the Schema URL, use editor variables to specify the path to the Schema file.

Note: It is a good practice to store all resources in the framework directory and use the \${framework} editor variable to reference them. This is a recommended approach to designing a self-contained document type that can be easily maintained and shared between different users.

The Classpath Tab

The **Classpath** tab displays a list of folders and JAR libraries that hold implementations for API extensions, implementations for custom **Author** mode operations, different resources (such as stylesheets), and framework translation files. Oxygen XML Developer plugin loads the resources looking in the folders in the order they appear in the list.

In the Classpath tab you can perform the following actions:

+ New

Opens a dialog box that allows you to add a resource in the Classpath tab.

🛂 Fdi

Opens a dialog box that allows you to edit a resource in the Classpath tab.

Delete

Deletes the currently selected resource.

Moves the selection to the previous resource.

Move Down

Moves the selection to the following resource.

The Author Tab

The **Author** tab is a container that holds information regarding the CSS file used to render a document in the **Author** mode, and regarding framework-specific actions, menus, contextual menus, toolbars, and content completion list of proposals.

The options that you configure in the **Author** tab are grouped in the following sub-tabs: **CSS**, **Actions**, **Menu**, **Contextual menu**, **Toolbar**, **Content Completion**.

CSS

The **CSS** subtab contains the CSS files that Oxygen XML Developer plugin uses to render a document in the **Author** mode. In this subtab, you can set *main* and *alternate* CSS files. When you are editing a document in the **Author** mode, you can switch between these CSS files from the **Styles** drop-down menu on the **Author Styles** toolbar.

The following actions are available in the **CSS** subtab:

Opens a dialog box that allows you to add a CSS file.

🔦 Edi

Opens a dialog box that allows you to edit a CSS file.

Delete

Deletes the currently selected CSS file.

♦ Move Up

Moves the selected CSS file up in the list.

Move Down

Moves the selected CSS file down in the list.

Enable multiple selection of alternate CSSs

Allows users to apply multiple alternate styles, as layers, over the main CSS style. This option is enabled by default for DITA document types.

ignore CSSs from the associated document type

The CSS files set in the CSS tab are overwritten by the CSS files specified in the document itself.

merge them with CSSs from the associated document type

The CSS files set in the CSS tab are merged with the CSS files specified in the document itself.

Actions

The **Actions** sub-tab holds the framework specific actions. Each action has an unique ID, a name, a description, and a shortcut key.

The following actions are available in this sub-tab:

+ New

Opens the Action dialog box that allows you to add an action.

Duplicate

Duplicates the currently selected action.

Edit

Opens a dialog box that allows you to edit an existing action.

X Delete

Deletes the currently selected action.

The Action Dialog Box

To edit an existing document type action or create a new one, *open the Preferences dialog box*, go to **Document Type Association**, select a document type, and click **Edit** or **New**. The **Document type configuration dialog box** is presented.

In this dialog box, go to the **Author** tab, click **Actions**, select an action, and click **Edit**, or to create a new action click **New**.

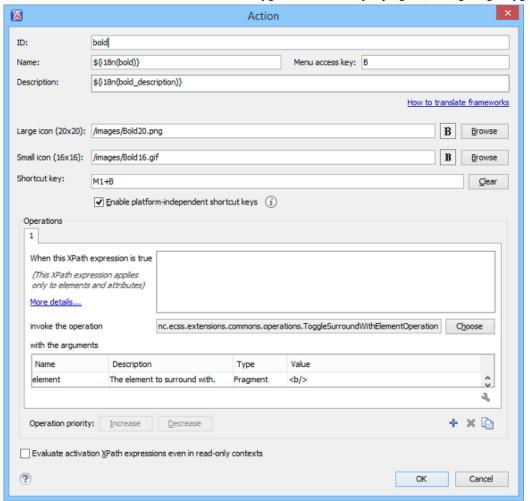

Figure 259: The Action Dialog Box

The following options are available in the **Action** dialog box:

- **ID** Specifies a unique action identifier.
- Name Specifies the name of the action. This name is displayed as a tooltip or as a menu item.
- **Menu access key** In Windows, the menu items are accessed using the shortcut when the menu is visible. The letter is visually represented by underlining the first occurrence of the letter in the menu item **Name**.
- **Description** A description of the action.
- Large icon Allows you to select an image for the icon that Oxygen XML Developer plugin uses for the toolbar
 action.

Tip: A good practice is to store the image files inside the framework directory and use the \$ {frameworks} editor variable to make the image relative to the framework location. If the images are bundled in a *jar* archive (for instance, along with some Java operations implementation), it is convenient to reference the images by their relative path location in the *class-path*.

- **Small icon** Allows you to select an image for the icon that Oxygen XML Developer plugin uses for the contextual menu action.
- **Shortcut key** This field allows you to configure a shortcut key for the action that you are editing. The + character separates the keys. If the **Enable platform-independent shortcut keys** checkbox is enabled, the shortcut that you specify in this field is platform-independent and the following modifiers are used:
 - M1 represents the **Command** key on MacOS X, and the **Ctrl** key on other platforms.
 - M2 represents the **Shift** key.

- M3 represents the **Option** key on MacOS X, and the **Alt** key on other platforms.
- M4 represents the <u>Ctrl</u> key on MacOS X, and is undefined on other platforms.

Operations

In this section of the **Action** dialog box, you configure the functionality of the action that you are editing. An action has one or more operation modes. The evaluation of an XPath expression activates an operation mode. The first enabled operation mode is activated when you trigger the action. The scope of the XPath expression must consist only of element nodes and attribute nodes of the edited document. Otherwise, the XPath expression does not return a match and does not fire the action. For more details see: *Activation of Multiple Functions for Actions using XPath Expressions* on page 547.

The following options are available in this section:

- When this XPath expression is true An XPath 2.0 expression that applies to elements and attributes. For more details see: Activation of Multiple Functions for Actions using XPath Expressions on page 547.
- **invoke the operation** Specifies the invoked operation.
- with the arguments Specifies the arguments of the invoked operation.
- Edit Allows you to edit the arguments of the operation.
- **Operation priority** Increases or decreases the priority of an operation. The operations are invoked in the order of their priority. If more than one XPath expression is true, the operation with the highest priority is invoked.
 - Add Adds an operation.
 - Remove Removes an operation.
 - **Duplicate** Duplicates an operation.
- Evaluate activation XPath expressions even in read-only cotnexts If this checkbox is enabled, the action can be invoked even when the cursor is placed in a read-only location.

Activation of Multiple Functions for Actions using XPath Expressions

An **Author** mode action can have multiple functions, each function invoking an **Author** mode operation with certain configured parameters. Each function of an action has an XPath 2.0 expression for activating it.

For each function of an action, the application will check if the XPath expression is fulfilled (when it returns a not empty nodes set or a *true* result). If it is fulfilled, the operation defined in the function will be executed.

Two special XPath extension functions are provided: the <code>oxy:allows-child-element()</code> function that you can use to check whether an element is valid in the current context, considering the associated schema and the <code>oxy:current-selected-element()</code> function that you can use to get the currently selected element.

The oxy:allows-child-element() Function

This extension function allows author actions to be available in a context only if the associated schema permits it.

The oxy:allows-child-element() is evaluated at the cursor position and has the following signature: oxy:allows-child-element(\$childName, (\$attributeName, \$defaultAttributeValue, \$contains?)?).

The following parameters are supported:

childName

The name of the element that you want to check if it is valid in the current context. Its value is a string that supports the following forms:

• The child element with the specified local name that belongs to the default namespace.

```
oxy:allows-child-element("para")
```

The above example verifies if the para element (of the default namespace) is allowed in the current context.

• The child element with the local name specified by any namespace.

```
oxy:allows-child-element("*:para")
```

The above example verifies if the para element (of any namespace) is allowed in the current context.

• A prefix-qualified name of an element.

```
oxy:allows-child-element("prefix:para")
```

The prefix is resolved in the context of the element where the cursor is located. The function matches on the element with the para local name from the previous resolved namespace. If the prefix is not resolved to a namespace, the function returns a value of false.

• A specified namespace-URI-qualified name of an element.

```
oxy:allows-child-element("{namespaceURI}para")
```

The namespaceURI is the namespace of the element. The above example verifies if the para element (of the specified namespace) is allowed in the current context.

Any element.

```
oxy:allows-child-element("*")
```

The above function verifies if any element is allowed in the current context.

Note: A common use case of oxy:allows-child-element("*") is in combination with the attributeName parameter.

attributeName

The attribute of an element that you want to check if it is valid in the current context. Its value is a string that supports the following forms:

• The attribute with the specified name from no namespace.

```
oxy:allows-child-element("*", "class", " topic/topic ")
```

The above example verifies if an element with the class attribute and the default value of this attribute (that contains the topic/topic string) is allowed in the current context.

• The attribute with the local name specified by any namespace.

```
oxy:allows-child-element("*", "*:localname", " topic/topic ")
```

A qualified name of an attribute.

```
oxy:allows-child-element("*", "prefix:localname", " topic/topic ")
```

The prefix is resolved in the context of the element where the cursor is located. If the prefix is not resolved to a namespace, the function returns a value of false.

defaultAttributeValue

A string that represents the default value of the attribute. Depending on the value of the next parameter, the default value of the attribute must either contain this value or be equal with it.

contains

An optional boolean. The default value is true. For the true value, the default value of the attribute must contain the defaultAttributeValue parameter. If the value is false, the two values must be the same.

The oxy:current-selected-element() Function

This function returns the fully selected element. If no element is selected, the function returns an empty sequence.

```
oxy:current-selected-element()[self::p]/b
```

This example returns the b elements that are children of the currently selected p element.

Menu

In the **Menu** sub-tab you configure what *framework* specific actions appear in the Oxygen XML Developer plugin menu. The sub-tab is divided in two sections: **Available actions** and **Current actions**.

The **Available actions** section presents a table that displays the actions defined in the **Actions** sub-tab, along with their icon, ID, and name. The **Current actions** section holds the actions that are displayed in the Oxygen XML Developer plugin menu. To add an action in this section as a sibling of the currently selected action, use the **Add as sibling** button. To add an image in this section as a child of the currently selected action use the **Add as child** button.

The following actions are available in the Current actions section:

Contextual Menu

In the **Contextual menu** sub-tab you configure what framework-specific action the **Content Completion Assistant** proposes. The sub-tab is divided in two sections: **Available actions** and **Current actions**.

The **Available actions** section presents a table that displays the actions defined in the **Actions** sub-tab, along with their icon, ID, and name. The **Current actions** section holds the actions that are displayed in the contextual menu of a document belonging to the edited framework. To add an action in this section as a sibling of the currently selected action, use the **Add as sibling** button. To add an action in this section as a child of the currently selected action use the **Add as child** button.

Toolbar

In the **Toolbar** sub-tab you configure what framework-specific action the Oxygen XML Developer plugin toolbar holds. The sub-tab is divided in two sections: **Available actions** and **Current actions**.

The **Available actions** section presents a table that displays the actions defined in the **Actions** sub-tab, along with their icon, ID, and name. The **Current actions** section holds the actions that are displayed in the Oxygen XML Developer plugin toolbar when you work with a document belonging to the edited framework. To add an action in this section as a sibling of the currently selected action, use the **Add as sibling** button. To add an action in this section as a child of the currently selected action use the **Add as child** button.

Content Completion

In the **Content Completion** sub-tab you configure what framework-specific the **Content Completion Assistant** proposes. The sub-tab is divided in two sections; **Available actions** and **Current actions**.

The **Available actions** section presents a table that displays the actions defined in the **Actions** sub-tab, along with their icon, ID, and name. The **Current actions** section holds the actions that the **Content Completion Assistant** proposes when you work with a document belonging to the edited framework. To add an action in this section as a sibling of the currently selected action, use the Add as sibling button. To add an action in this section as a child of the currently selected action use the Add as child button.

The following actions are available in the Current actions section:

Edit

× Remove

Removes an item.

The Templates Tab

The **Templates** tab specifies a list of directories in which new file templates are located. These file templates are gathered from all the document types and presented in the **New** document dialog box.

Use the **Add**, **Edit**, and **Delete** button to add, configure, or remove templates. The **Templates directory** text field specifies the path to the directory of the template. It is recommended to use relative paths since absolute paths will make it difficult to share the templates with others.

You can also use wildcards in the paths for the template directories.

For example, using the following wildcard in the path would add all the template folders found inside the templates directory:

\${frameworkDir}/templates/*

The Catalogs Tab

The **Catalogs** tab specifies a list of *XML catalogs* which are added to all the catalogs that Oxygen XML Developer plugin uses to resolve resources.

The Transformation Tab

In the **Transformation** tab you configure the transformation scenarios associated with the framework you are editing. These are the transformation scenarios that are presented in the **Configure Transformation Scenarios** dialog box as associated with the type of the edited document.

You can set one or more of the scenarios from the **Transformation** tab as default. The scenarios set here as default are rendered bold in the **Configure Transformation Scenarios** dialog box and are also displayed on the tooltip of the **Apply transformation Scenario(s)**.

The **Transformation** tab offers the following options:

Nev

Opens the New scenario dialog box allowing you to create a new transformation scenario.

Edit

Opens the **Edit scenario** dialog box allowing you to edit the properties of the currently selected transformation scenario.

X Delete

Deletes the currently selected transformation scenario.

Import scenarios

The Validation Tab

In the **Validation** tab you configure the validation scenarios associated with the framework you are editing. These are the validation scenarios that are presented in the **Configure Validation Scenarios** dialog box as associated with the type of the edited document.

You can set one or more of the scenarios from the **Validation** tab as default. The scenarios set here as default are rendered bold in the **Configure Transformation Scenarios** dialog box and are also displayed on the tooltip of the **Apply transformation Scenario(s)** button.

The Validation tab offers the following options:

+ New

Opens the New scenario dialog box allowing you to create a new validation scenario.

🔧 Edii

Opens the Edit scenario dialog box allowing you to edit the properties of the currently selected validation scenario.

Delete

Deletes the currently selected validation scenario.

Import scenarios

The Extensions Tab

The **Extension** tab specifies implementations of Java interfaces used to provide advanced functionality to the document type.

Libraries containing the implementations must be present in the *classpath* of your document type. The Javadoc available at http://www.oxygenxml.com/InstData/Editor/SDK/javadoc/ contains details about how each API implementation functions.

Editor Preferences

Oxygen XML Developer plugin lets you configure how the editor appears. To configure the appearance of the text editor, *open the Preferences dialog box* and go to **Editor** or right click in the editor window and choose **Preferences**.

The following options are available:

- Editor background Sets the background color for both text editor and Diff Files editors.
- Completion proposal background Sets the background color of the content completion window.
- Completion proposal foreground Sets the foreground color of the content completion window.
- Documentation window background Sets the background color of the documentation of elements suggested by the content completion assistant.
- **Documentation window foreground** Sets the foreground color for the documentation of elements suggested by the content completion assistant.
- Display quick-assist and quick-fix side hints Displays the Quick Assist and Quick Fix icon in the editor's left side line number stripe.
- **Line wrap** Enables *soft wrap* of long lines, that is automatically wrap lines in edited documents. The document content is unaltered as the application does not use newline characters to break long lines.
 - 昂

Note: When you enable the **Line wrap** option, Oxygen XML Developer plugin disables the **Highlight** current line option.

- **Highlight matching tag** If you place the cursor on a start or end tag, Oxygen XML Developer plugin highlights the corresponding member of the pair. You can also customize the highlight color.
- **Beep on operation finished** Oxygen XML Developer plugin emits a short beep when a validate, check well-formedness, or transform action has ended;
 - =

Note: When the validation or the transformation process of a document is successful, the beep signal has a higher audio frequency, as opposed to when the validation fails, and the beep signal has a lower audio frequency. On the Windows platform, for other operations, the default system sound (Asterisk) is used . You can configure it by changing the sound theme.

• **Minimum fold range** - You can specify the minimum number of lines in a block for which the folding support becomes active. If you modify this value, the change takes effect next time you open / reopen the editor.

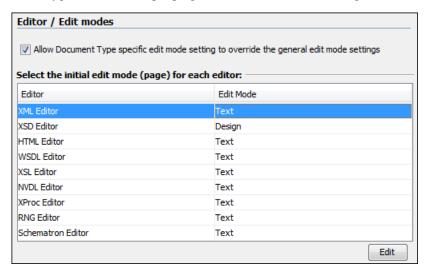

Edit modes Preferences

Oxygen XML Developer plugin lets you configure which *edit mode* a file is opened in the first time it is opened. This setting only affects the first time a file is opened. The current editing mode of each file is saved when the file is closed and restored the next time it is opened. To configure the **Edit modes** options, *open the Preferences dialog box* and go to **Editor** > **Edit modes**.

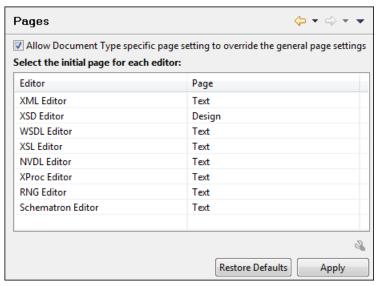

The initial edit mode can be one of the following:

- Text
- Grid
- **Design** (available only for the W3C XML Schema editor).

The Oxygen XML Developer plugin Edit Modes Preferences Page

The Oxygen XML Developer plugin Edit Modes Preferences Page

Grid Preferences

Oxygen XML Developer plugin provides a *Grid view* of an XML document. To configure the **Grid** options, *open the Preferences dialog box* and go to **Editor** > **Edit modes** > **Grid**.

The following options are available:

- **Compact representation** If selected, the *compact representation* of the grid is used: a child element is displayed beside the parent element. In the *non-compact representation*, a child element is nested below the parent.
- Format and indent when passing from grid to text or on save If selected, the content of the document is *formatted* and indented each time you switch from the Grid view to the Text view.
- **Default column width (characters)** Sets the default width in characters of a table column of the grid. A column can hold:
 - · Element names
 - Element text content
 - · Attribute names
 - Attribute values

If the total width of the grid structure is too large you can resize any column by dragging the column margins with the mouse pointer, but the change is not persistent. To make it persistent, set the new column width with this option.

- Active cell color Sets the background color for the active cell of the grid. There is only one active cell at a time. The keyboard input always goes to the active cell and the selection always contains it.
- Selection color Background color for the selected cells of the grid except the active cell.
- Border color The color used for the lines that separate the grid cells.
- Background color The background color of grid cells that are not selected.
- Foreground color The text color of the information displayed in the grid cells.
- Row header colors Background color The background color of row headers that are not selected.
- Row header colors Active cell color The background color of the row header cell that is currently active.
- Row header colors Selection color The background color of the header cells corresponding to the currently selected rows.
- Column header colors Background color The background color of column headers that are not selected.
- Column header colors Active cell color The background color of the column header cell that is currently active.
- Column header colors Selection color The background color of the header cells corresponding to the currently selected columns.

The column headers are painted with two color gradients, one for the upper 1/3 part of the header and the other for the lower 2/3 part. The start and end colors of the first gradient are set with the first two color buttons. The start and end colors of the second gradient are set with the last two color buttons.

Schema Design Preferences

Oxygen XML Developer plugin provides a *graphical schema design editor* to make editing XML schemas easier. To configure the **Schema Design** options, *open the Preferences dialog box* and go to **Editor** > **Edit modes** > **Schema Design**

The following options are available in the **Schema Design** preferences page:

- Show annotation in the diagram When selected, Oxygen XML Developer plugin displays the content of xs:documentation elements in the XML Schema **Design** view.
- When trying to edit components from another schema The schema diagram editor will combine schemas imported by the current schema file into a single schema diagram. You can choose what happens if you try to edit a component from an imported schema. The options are:
 - Always go to its definition Oxygen XML Developer plugin opens the imported schema file so that you can edit it.
 - Never go to its definition The imported schema file is not opened. The definition cannot be edited in place.
 - Always ask Oxygen XML Developer plugin asks if you want to open the imported schema file.

Properties

Oxygen XML Developer plugin lets you control which properties to display for XML Schema components in the *XML Schema Design view*. To configure the schema design properties displayed, *open the Preferences dialog box* and go to **Editor** > **Edit modes** > **Schema Design** > **Properties**.

This preferences page contains the following:

Show additional properties in the diagram

If this option is selected, the properties selected in the property table are shown in the XML Schema **Design** mode. This option is selected by default.

Properties Table

Show - Use this column in the table to select the properties that you want to be displayed in the XML Schema **Design** mode.

Only if specified - Use this column to select if you want the property to be displayed only if it is defined in the schema.

For certain XML languages, Oxygen XML Developer plugin provides a diagram view as part of the text mode editor. To configure the **Diagram** preferences, *open the Preferences dialog box* and go to **Editor** > **Edit modes** / **Pages** > **Text Diagram**.

The following options are available:

• Show Full Model XML Schema diagram - When this option is selected, the **Text** mode editor for XML Schemas is displayed with a split screen view that shows a diagram of the schema structure. This may be useful for seeing the effect of schema changes you make in text view. For editing a the schema using diagram rather than text, use the *schema Design view*.

Note: When handling very large schemas, displaying the schema diagram might affect the performance of your system. In such cases, disabling the schema diagram view improves the speed of navigation through the edited schema.

- Enable Relax NG diagram and related views Enables the Relax NG schema diagram and synchronization with the related views (Attributes, Model, Elements, Outline).
 - Show Relax NG diagram Displays the Relax NG schema diagram in Full Model View and Logical Model View.
- Enable NVDL diagram and related views Enables the NVDL schema diagram and synchronization with the related views (Attributes, Model, Elements, Outline).
 - Show NVDL diagram Displays the NVDL schema diagram in Full Model View and Logical Model View.
- Location relative to editor Allows you to specify the location of the schema diagram panel relative to the diagram
 Text editor.

Format Preferences

This preferences page contains various formatting options which influence editing and formatting in the **Text** mode.

Note: These settings apply to the formatting of source documents. The formatting of output documents is determined by the *transformation scenarios that create them*.

The following options are available:

• **Detect indent on open** - Oxygen XML Developer plugin detects how a document is indented when it is opened. Oxygen XML Developer plugin uses a heuristic method of detection by computing a weighted average indent value from the initial document content. You can disable this setting if the detected value does not work for your particular case and you want to use a fixed-size indent for all the edited documents.

Tip: If you want to minimize the formatting differences created by the **Format and Indent** operation in a document edited in the **Text** edited mode, make sure that both the **Detect indent on open** and **Detect line** width on open options are enabled.

- Use zero-indent, if detected By default, if no indent was detected in the document, the fixed-size indent is used. Enable this option if all your document have no indentation and you want to keep them that way.
- Indent with tabs If selected, indents are created using tab characters. If unchecked, lines are indented using space characters.
- Indent size A fixed number of spaces used for indenting a line.
- Hard line wrap (Limit to "Line width Format and Indent") If selected, when typing content in the Text editing mode when the maximum line width is reached, a line break is automatically inserted.
- **Indent on enter** If disabled, when you press the Enter key to insert a line break in the **Text**editing mode, no indentation will be added to the new line.
- Enable smart enter If selected, when you press the Enter key between a start and an end XML tag in the Text editing mode, the cursor is placed in an indented position on the empty line formed between the start and end tag.

- Detect line width on open When selected, Oxygen XML Developer plugin detects the line width automatically
 when the document is opened.
- Format and indent the document on open When selected, an XML document is formatted and indented before
 opening it in Oxygen XML Developer plugin.
- Line width Format and Indent Defines the number of characters after which the Format and Indent (pretty-print) action performs hard line wrapping. For example, if set to 100, after a Format and Indent action, the longest line will have at most 100 characters. This setting is also used when saving the XML content edited in the Author editing mode.

Note: In order to avoid having an indent that is longer than the line width setting and without having sufficient space available for the text content, the indent limit is actually set at half the value of the **Line width** - **Format and Indent** setting. The remaining space is reserved for text.

Clear undo buffer before Format and Indent - The Format and Indent operation can be undone, but if used
intensively, a considerable amount of the memory allocated for Oxygen XML Developer plugin will be used for
storing the undo states. If this option is selected, Oxygen XML Developer plugin empties the undo buffer before
doing a Format and Indent operation. This means you will not be able to undo any changes you made before the
format and indent operation. Select this option if you encounter out of memory problems (OutOfMemoryError)
when performing the Format and Indent operation.

The indent size and line width limit settings are used in various places in the application:

- When the **Format and Indent** action is used in the **Text** editing mode.
- When you press ENTER in the **Text** editing mode to break a line.
- When editing in the **Text** mode with **Hard line wrap** enabled.

To watch our video demonstration about the formatting options offered by Oxygen XML Developer plugin, go to http://oxygenxml.com/demo/Autodetect_Formating.html.

XML Formatting Preferences

To configure the **XML** Formatting options, open the **Preferences** dialog box and go to **Editor** > **Format** > **XML**.

The following options are available:

Format Section

This section includes the following drop down boxes:

Preserve empty lines

The **Format and Indent** operation preserves all empty lines found in the document.

Preserve text as it is

The **Format and Indent** operation preserves text content as it is, without removing or adding any white space.

Preserve line breaks in attributes

Line breaks found in attribute values are preserved.

Note: When this option is enabled, the **Break long attributes** option is automatically disabled.

Break long attributes

The **Format and Indent** operation breaks long attribute values.

Indent inline elements

The *inline elements* are indented on separate lines if they are preceded by white spaces and they follow another element start or end tag. For example:

Original XML:

```
<root>
  text <parent> <child></child> </parent>
</root>
```

Indent inline elements enabled:

Indent inline elements disabled:

```
<root> text <parent> <child/> </parent> </root>
```

Expand empty elements

The **Format and Indent** operation outputs empty elements with a separate closing tag (for example, < a atr1="v1">). When not enabled, the same operation represents an empty element in a more compact form (< a atr1="v1"/>).

Sort attributes

The **Format and Indent** operation sorts the attributes of an element lexicographically.

Add space before slash in empty elements

Inserts a space character before the trailing / and > of empty elements.

Break line before an attribute name

The Format and Indent operation breaks the line before the attribute name.

Element Spacing Section

This section controls how the application handles whitespaces found in XML content. You can **Add** or **Remove** element names or simplified XPath expressions in the various tabs.

Note: The XPath expressions can accept the following attribute conditions (default attribute values are not taken into account):

- element [@attr] Matches all instances of the specified element that include the specified attribute.
- element[not(@attr)] Matches all instances of the specified element that do not include the specified attribute.
- *element[@attr = "value"]* Matches all instances of the specified element that include the specified attribute with the given value.
- element[@attr!= "value"] Matches all instances of the specified element that include the specified attribute and its value is different than the one given.

The tabs are as follows:

Preserve space

List of elements for which the **Format and Indent** operation preserves the whitespaces (such as blanks, tabs, and newlines). The elements can be specified by name or by simplified XPath expressions:

- elementName
- //elementName
- /elementName1/elementName2/elementName3
- //xs:localName

Note: The namespace prefixes (such as xs) are treated as part of the element name without taking its binding to a namespace into account.

Default space

List of elements for which the content is normalized (multiple contiguous whitespaces are replaced by a single space), before applying the **Format and Indent** operation.

Mixed content

The elements from this list are treated as mixed content when applying the **Format and Indent** operation. The lines are split only when whitespaces are encountered.

Line break

List of elements for which line breaks will be inserted, regardless of their content. You can choose to break the line *before* the element, *after*, or both.

Schema aware format and indent

The **Format and Indent** operation takes the schema information into account with regards to the *space preserve*, *mixed*, or *element only* properties of an element.

Indent Section

Includes the following options:

Indent (when typing) in preserve space elements

Normally, the *Preserve space* elements (identified by the xml:space attribute set to preserve or by their presence in the **Preserve space** elements list) are ignored by the **Format and Indent** operation. When this option is enabled and you edit one of these elements, its content is formatted.

Indent on paste - sections with number of lines less than 300

When you paste a chunk of text that has less than 300 lines, the inserted content is indented. To keep the original indent style of the document you copy content from, disable this option.

Whitespaces Preferences

When Oxygen XML Developer plugin formats and indents XML documents, a whitespace normalization process is applied, thus replacing whitespace sequences with single space characters. Oxygen XML Developer plugin allows you to configure which Unicode characters are treated as spaces during the normalization process.

To configure the **Whitespace** preferences, *open the Preferences dialog box* and go to **Editor** > **Format** > **XML** > **Whitespaces**.

This table lists the Unicode whitespace characters. Check any that you want to have treated as whitespace when formatting and indenting an XML document.

The whitespaces are normalized when the Format and Indent action is applied on an XML document.

Note: The whitespace normalization process replaces any sequence of characters declared as whitespaces in the **Whitespaces** table with a single space character (U+0020). If you want to be sure that a certain whitespace character will not be removed in the normalization process, deselect it in the **Whitespaces** table.

Important: The characters with the codes U+0009 (TAB), U+000A (LF), U+000D (CR) and U+0020 (SPACE) are always considered to be whitespace characters and cannot be deselected.

XQuery Formatting Preferences

To configure the **XQuery** Formatting options, *open the Preferences dialog box* and go to **Editor** > **Format** > **XQuery**.

The following options are available:

- **Preserve line breaks** All initial line breaks are preserved.
- Break line before an attribute name Each attribute of an XML element is written on a new line and properly
 indented.

XPath Formatting Preferences

To configure the **XPath** Formatting options, open the **Preferences** dialog box and go to **Editor** > **Format** > **XPath**.

The following option is available:

Format XPath code embedded in XSLT, XSD and Schematron files - If enabled, the Format and Indent action
applied on a XSD, XSLT, or Schematron document will perform an XPath-specific formatting on the values of the
attributes that accept XPath expressions.

Note: For XSLT documents, the formatting is not applied to *attribute value templates*.

CSS Properties Formatting Preferences

Oxygen XML Developer plugin can format and indent your CSS files. To configure the **CSS** formatting options, *open the Preferences dialog box* and go to **Editor** > **Format** > **CSS**.

The following options control how your CSS files are formatted and indented:

Class body on new line

If enabled, the class body (including the curly brackets) is placed on a new line. Disabled by default.

Indent class content

When enabled, the *class* content is indented. Enabled by default.

Add space before the value of a CSS property

When enabled, whitespaces are added between the : (colon) and the value of a style property. Enabled by default.

Add new line between classes

If enabled, an empty line is added between two classes. Disabled by default.

Preserve empty lines

When enabled, the empty lines from the CSS content are preserved. Enabled by default.

Allow formatting embedded CSS

When enabled, CSS content that is embedded in XML is also formatted when the XML content is formatted. Enabled by default.

JavaScript Properties Formatting Preferences

To configure the JavaScript format options, open the Preferences dialog box and go to Editor > Format > JavaScript.

The following options control the behavior of the **Format and Indent** action:

- Start curly brace on new line Opening curly braces start on a new line.
- Preserve empty lines Empty lines in the JavaScript code are preserved. This option is enabled by default.
- Allow formatting embedded JavaScript Applied only to XHTML documents, this option allows Oxygen XML
 Developer plugin to format embedded JavaScript code, taking precedence over the Schema aware format and indent
 option. This option is enabled by default.

Content Completion Preferences

Oxygen XML Developer plugin provides a *Content Completion Assistant* that list available options at any point in a document and can auto-complete structures, elements, and attributes. These options control how the **Content Completion Assistant** works.

To configure the **Content Completion** preferences, *open the Preferences dialog box* and go to **Editor** > **Content Completion**.

The following options are available:

- Auto close the last opened tag Oxygen XML Developer plugin closes the last open tag when you type </.
- Automatically rename/delete/comment matching tag If you rename, delete, or comment out a start tag, Oxygen XML Developer plugin automatically renames, deletes, or comments out the matching end tag.

Note: If you select **Toggle comment** for multiple starting tags and the matching end tags are on the same line as other start tags, the end tags are not commented.

- Use content completion Turns content completion on or off.
- Close the inserted element When you choose an entry from the Content Completion Assistant list of proposals, Oxygen XML Developer plugin inserts both start and end tags.
 - **If it has no matching tag** The end tag of the inserted element is automatically added only if it is not already present in the document.
 - Add element content Oxygen XML Developer plugin inserts the required elements specified in the DTD, XML Schema, or RELAX NG schema that is associated with the edited XML document.

- Add optional content Oxygen XML Developer plugin inserts the optional elements specified in the DTD, XML Schema, or RELAX NG schema.
- Add first Choice particle Oxygen XML Developer plugin inserts the first choice particle specified in the DTD, XML Schema, or RELAX NG schema.
- Case sensitive search When enabled, the search in the content completion assistant window when you type a character is case-sensitive ('a' and 'A' are different characters).
 - =

Note: This option is ignored when the current language itself is not case sensitive. For example, the case is ignored in the CSS language.

- **Cursor position between tags** When selected, Oxygen XML Developer plugin automatically moves the cursor between start and end tag after inserting the element. This only applies to:
 - Elements with only optional attributes or no attributes at all.
 - Elements with required attributes, but only when the **Insert the required attributes** option is disabled.
- Show all entities Oxygen XML Developer plugin displays a list with all the internal and external entities declared in the current document when you type the start character of an entity reference (for example, &).
- **Insert the required attributes** Oxygen XML Developer plugin inserts automatically the required attributes taken from the DTD or XML Schema.
- **Insert the fixed attributes** Oxygen XML Developer plugin automatically inserts any FIXED attributes from the DTD or XML Schema for an element inserted with the help of the **Content Completion Assistant**.
- Show recently used items when checked, Oxygen XML Developer plugin remembers the last inserted items from the Content Completion Assistant window. The number of items to be remembered is limited by the Maximum number of recent items shown list box. These most frequently used items are displayed on the top of the content completion window their icon is decorated with a small red square..
- **Maximum number of recent items shown** limits the number of recently used items presented at the top of the **Content Completion Assistant** window.
- Learn attributes values Oxygen XML Developer plugin learns the attribute values used in a document.
- Learn on open document Oxygen XML Developer plugin automatically learns the document structure when the document is opened.
- Learn words (Dynamic Abbreviations, available on <u>Ctrl Space (Command Space on OS X)</u>) When selected, Oxygen XML Developer plugin learns the typed words and makes them available in a content completion fashion by pressing <u>Ctrl Space (Command Space on OS X)</u> om your keyboard;
 - Ę

Note: In order to be learned, the words need to be separated by space characters.

Annotations Preferences

Different types of schemas (XML Schema, DTDs, Relax NG) can include annotations that document the various elements and attributes that they define. Oxygen XML Developer plugin can display these annotations when offering content completion suggestions. To configure the **Annotations** preferences, *open the Preferences dialog box* and go to **Editor** > **Content Completion** > **Annotations**.

The following options are available:

Show annotations in Content Completion Assistant

Oxygen XML Developer plugin displays the schema annotations of an element, attribute, or attribute value currently selected in the **Content Completion Assistant** proposals list.

Show annotations in tooltip

Oxygen XML Developer plugin displays the annotation of elements and attributes as a tooltip when you hover over them with the cursor in the editing area or in the **Elements** view.

Show annotation in HTML format, if possible

This option allows you to view the annotations associated with an element or attribute in HTML format. It is available when editing XML documents that have associated an XML Schema or Relax NG schema. When this option is disabled the annotations are converted and displayed as plain text.

Prefer DTD comments that start with "doc:" as annotations

To address the lack of dedicated annotation support in DTD documents, Oxygen XML Developer plugin recommends prefixing with the doc: particle all comments intended to be shown to the developer who writes an XML validated against a DTD schema.

When this option is enabled, Oxygen XML Developer plugin uses the following mechanism to collect annotations:

- If at least one doc: comment is found in the entire DTD, only comments of this type are displayed as annotations.
- If no doc: comment is found in the entire DTD, all comments are considered annotations and displayed as such

When the option is disabled, all comments, regardless of their type, are considered annotations and displayed as such.

Use all Relax NG annotations as documentation

When this option is selected, any element outside the Relax NG namespace, that is

http://relaxng.org/ns/structure/1.0, is considered annotation and is displayed in the annotation window next to the **Content Completion Assistant** window and in the **Model** view. When this option is not selected, only elements from the Relax NG annotations namespace, that is

http://relaxng.org/ns/compatibility/annotations/1.0 are considered annotations.

XSL Preferences

XSL stylesheets are often used to create output in XHTML or XSL-FO. In addition to suggesting content completion options for XSLT stylesheet elements, Oxygen XML Developer plugin can suggest elements from these vocabularies. To configure the XSL content completion options, *open the Preferences dialog box* and go to **Editor** > **Content Completion** > **XSL**.

The following options are available:

• Automatically detect XHTML transitional or Formatting objects - Detects if the output being generated is XHTML or FO and provides content completion for those vocabularies. Oxygen XML Developer plugin analyzes the namespaces declared in the root element to find an appropriate schema.

If the detection fails, Oxygen XML Developer plugin uses one of the following options:

- None The Content Completion Assistant suggests only XSLT elements.
- **XHTML transitional** The **Content Completion Assistant** includes XHTML transitional elements as substitutes for xsl:element.
- **Formatting objects** The **Content Completion Assistant** includes Formatting Objects (XSL-FO) elements as substitutes for xsl:element.
- Custom schema If you want content completion hints for a different output vocabulary, enter the path to the schema for that vocabulary here. The supported schema types are DTD, XML Schema, RNG schema, or NVDL schema for inserting elements from the target language of the stylesheet.
- **Documentation schema** You can choose an additional schema that will be used for documenting XSL stylesheets. Choose between the following:
 - Build-in schema Uses the built-in schema for documentation.
 - **Custom schema** Allows you to specify a custom schema for documentation. The supported schema types are XSD, RNG, RNC, DTD, and NVDL.

XPath Preferences

Oxygen XML Developer plugin provides content-completion support for XPath expressions. To configure the options for the content completion in XPath expressions, *open the Preferences dialog box* and go to **Editor** > **Content Completion** > **XPath**.

The following options are available:

• Enable content completion for XPath expressions - Enables the Content Completion Assistant in XPath expressions that you enter in the match, select, and test XSL attributes and also in the XPath toolbar.

- **Include XPath functions** When this option is selected, XPath functions are included in the content completion suggestions.
- **Include XSLT functions** When this option is selected, XSLT functions are included in the content completion suggestions.
- **Include axes** When this option is selected, XSLT axes are included in the content completion suggestions.
- Show signatures of XSLT / XPath functions Makes the editor indicate the signature of the XPath function located at the cursor position in a tooltip. See the XPath Tooltip Helper section for more information.

XSD Preferences

Oxygen XML Developer plugin provides content completion assistance when you are writing an XML Schema (XSD). To configure XSD preferences, *open the Preferences dialog box* and go to **Editor** > **Content Completion** > **XSD**. The options in this preferences page define what elements are suggested by the **Content Completion Assistant**, in addition to the ones from the XML Schema (defined by the xs:annotation/xs:appinfo elements).

The following options are available:

- None The Content Completion Assistant offers only the XML Schema schema information.
- ISO Schematron The Content Completion Assistant includes ISO Schematron elements in xs:appinfo.
- Schematron 1.5 The Content Completion Assistant includes Schematron 1.5 elements in xs:appinfo.
- Other The Content Completion Assistant includes in xs:appinfo elements from an XML Schema identified by an URL.

Syntax Highlight Preferences

Oxygen XML Developer plugin supports syntax highlighting of XML in the *Text mode* editor, DTD, Relax NG (XML and Compact Syntax), Java, JavaScript / JSON, PHP, CSS, XQuery, C++, C, Perl, Properties, SQL, Shell and Batch documents.

To configure syntax highlighting, open the Preferences dialog box and go to Editor > Syntax Highlight.

To set syntax colors for a language, expand the listing for that language in the top panel to show the list of syntax items for that language. Use the color and style selectors to change how each syntax item is displayed. The results of your changes are displayed in the preview panel. If you do not know the name of the syntax token that you want to configure, click that token in the **Preview** area to select it.

Note: All default color sets come with a high-contrast variant, which is automatically used when you switch to a black-background or white-background high-contrast theme in your Windows operating system settings. The high-contrast theme will not overwrite any default color you set in **Editor** > **Syntax Highlight** preferences page.

The settings for XML documents are used also in XSD, XSL, RNG documents. The **Preview** area has separate tabs for XML, XSD, XSL, RNG.

The **Enable nested syntax highlight** option controls if different content types mixed in the same file (like PHP, JS and CSS scripts inside an HTML file) are highlighted according with the color schemes defined for each content type.

Elements / Attributes by Prefix Preferences

Oxygen XML Developer plugin lets you specify different colors for XML elements and attributes with specific namespace prefixes. To configure the **Elements / Attributes by Prefix** preferences, *open the Preferences dialog box* and go to **Editor > Syntax Highlight > Elements / Attributes by Prefix**.

To change the syntax coloring for a specific namespace prefix, choose the prefix from the list, or add a new one using the **New** button, and use the color and style selectors to set the syntax highlighting style for that namespace prefix.

Note: Syntax highlighting is based on the literal namespace prefix, not the namespace that the prefix is bound to in the document.

If you want only the prefix, and not the whole element or attribute name, to be styled differently, select **Draw only the prefix with a separate color**.

Open / Save Preferences

Oxygen XML Developer plugin lets you control how files are opened and saved. To configure the **Open / Save** options, open the **Preferences** dialog box and go to **Editor > Open / Save**.

Open

The following options apply to opening files:

- **Format document when longest line exceeds** Oxygen XML Developer plugin will create line breaks if the characters in a line exceed the specified value. You can choose one of the following:
 - Always format
 - Never format
 - Always ask

Save

The following options apply to saving files:

- Check errors on save If enabled, Oxygen XML Developer plugin runs a validation that checks your document for errors before saving it.
- Save all files before transformation or validation Saves all open files before validating or transforming an XML document. This ensures that any dependencies are resolved when modifying the XML document and its XML Schema.

Performance

The following options cover performance issues when dealing with large files:

Clear undo buffer on save - If selected, Oxygen XML Developer plugin clears its undo buffer when you save a
document. Therefore, modifications made prior to saving the document cannot be undone. Select this option if you
frequently encounter *out of memory* errors when editing large documents.

Save Hooks Preferences

Oxygen XML Developer plugin includes an option for automatically compiling LESS stylesheets. To set this option, *open the Preferences dialog box* and go to **Editor** > **Open / Save** > **Save hooks**.

The following option can be enabled or disabled:

Automatically compile LESS to CSS when saving - If enabled, when you save a LESS file it will automatically
be compiled to CSS (disabled by default).

Important: If this option is enabled, when you save a LESS file, the CSS file that has the same name as the LESS file is overwritten without warning. Make sure all your changes are made in the LESS file. Do not edit the CSS file directly, as your changes might be lost.

Templates Preferences

This page groups the preferences for code templates and document templates:

- Code Templates
- Document Templates

Code Templates Preferences

Code templates are code fragments that can be inserted at the current editing position. Oxygen XML Developer plugin comes with a set of built-in templates for CSS, LESS, Schematron, XSL, XQuery, and XML Schema document types. You can also define your own code templates and share them with your colleagues using the template export and import functions.

To configure Code Templates, open the Preferences dialog box and go to Editor > Templates > Code Templates.

This preferences page contains a list of all the available code templates (both built-in and custom created ones) and a code preview area. You can disable any code template by deselecting it.

The following actions are available:

New

Opens the **Code template** dialog box that allows you to define a new code template. You can define the following fields:

- Name The name of the code template.
- **Description** The description of the code template that will appear in the **Code Templates** preferences page and in the tooltip message when selecting it from the **Content Completion Assistant**. HTML markup can be used for better rendering.
- Associate with You can choose to set the code template to be associated with a specific type of editor or for all editor types.
- **Shortcut key** Allows you to configure a shortcut key that can be used to insert the code template. The + character separates keys. If the **Enable platform-independent shortcut keys** checkbox is enabled, the shortcut is platform-independent and the following modifiers are used:
 - M1 represents the **Command** key on MacOS X, and the **Ctrl** key on other platforms.
 - M2 represents the **Shift** key.
 - M3 represents the **Option** key on MacOS X, and the **Alt** key on other platforms.
 - M4 represents the **Ctrl** key on MacOS X, and is undefined on other platforms.
- Content Text box where you define the content that is used when the code template is inserted.

Edit

Opens the **Code template** dialog box and allows you to edit an existing code template. You can edit the following fields:

- Description The description of the code template that will appear in the Code Templates preferences page
 and in the tooltip message when selecting it from the Content Completion Assistant. HTML markup can be
 used for better rendering.
- **Shortcut key** Allows you to configure a shortcut key that can be used to insert the code template. The + character separates keys. If the **Enable platform-independent shortcut keys** checkbox is enabled, the shortcut is platform-independent and the following modifiers are used:
 - M1 represents the **Command** key on MacOS X, and the **Ctrl** key on other platforms.
 - M2 represents the **Shift** key.
 - M3 represents the **Option** key on MacOS X, and the **Alt** key on other platforms.
 - M4 represents the **Ctrl** key on MacOS X, and is undefined on other platforms.
- Content Text box where you define the content that is used when the code template is inserted.

Duplicate

Creates a duplicate of the currently selected code template.

Delete

Deletes the currently selected code template. This action is disabled for the built-in code templates.

Export

Exports a file with code templates.

Import

Imports a file with code templates that was created by the **Export** action.

You can use the following *editor variables* when you define a code template in the **Content** text box:

• *\${caret}* - The position where the cursor is located. This variable can be used in a code template, in **Author** mode operations, or in a selection plugin.

- *\${selection}* The current selected text content in the current edited document. This variable can be used in a code template, in **Author** mode operations, or in a selection plugin.
- \${ask('message', type, ('real_value1': 'rendered_value1'; 'real_value2': 'rendered_value2'; ...), 'default_value')} To prompt for values at runtime, use the ask('message', type, ('real_value1': 'rendered_value1'; 'real_value2': 'rendered_value2'; ...), 'default-value'') editor variable. You can set the following parameters:
 - 'message' The displayed message. Note the quotes that enclose the message.
 - type Optional parameter, with one of the following values:

Parameter	
url	Format: \${ask('message', url, 'default_value')}
	Description: Input is considered a URL. Oxygen XML Developer plugin checks that the provided URL is valid.
	Example:
	 \${ask('Input URL', url)}-The displayed dialog box has the name Input URL. The expected input type is URL. \${ask('Input URL', url, 'http://www.example.com')}-The displayed dialog box has the name Input URL. The expected input type is URL.
	The input field displays the default value http://www.example.com.
password	Format: \${ask('message', password, 'default')}
	Description: The input is hidden with bullet characters.
	Example:
	 \${ask('Input password', password)} - The displayed dialog box has the name 'Input password' and the input is hidden with bullet symbols. \${ask('Input password', password, 'abcd')} - The displayed dialog box has the name 'Input password' and the input hidden with bullet symbols. The input field already contains the default abcd value.
generic	Format: \${ask('message', generic, 'default')}
	Description: The input is considered to be generic text that requires no special handling.
	Example:
	 \${ask('Hello world!')} - The dialog box has a Hello world! message displayed. \${ask('Hello world!', generic, 'Hello again!')} - The dialog box has a Hello world! message displayed and the value displayed in the input box is 'Hello again!'.
relative_url	Format: \${ask('message', relative_url, 'default')}
	Description: Input is considered a URL. Oxygen XML Developer plugin tries to make the URL relative to that of the document you are editing.
	Note: If the \$ask editor variable is expanded in content that is not yet saved (such as an <i>untitled</i> file, whose path cannot be determined), then Oxygen XML Developer plugin will transform it into an absolute URL.
	Example:
	• \$\langle \langle \la

•	- 1	

Parameter			
	Note: The 'default' parameter specifies the default selected value and can match either a key or a value.		
	<pre>Example: \$\{ask('Operating System', radio, ('win':'Microsoft Windows';'osx':'Mac OS X';'lnx':'Linux/UNIX'), 'osx')\} - The dialog box has the name 'Operating System'. The radio button group allows you to choose between the three operating systems.</pre>		
	Note: In this example Mac OS X is the default selected value and if selected it would return osx for the output.		

- 'default-value' optional parameter. Provides a default value.
- results in different output files on each transform.
- *\$\{uuid\}* Universally unique identifier, a unique sequence of 32 hexadecimal digits generated by the Java *UUID* class.
- \$\(\frac{10}{10}\) Application-level unique identifier; a short sequence of 10-12 letters and digits which is not guaranteed to be universally unique.
- \$\(\frac{1}{2}\) Current file name without extension and without parent folder. The current file is the one currently opened and selected.
- \$\(\) cfine\(\) Current file name with extension. The current file is the one currently opened and selected.
- \$\(\frac{1}{2}\) Current file as file path, that is the absolute file path of the current edited document.
- \$\(cfd \)\] Current file folder as file path, that is the path of the current edited document up to the name of the parent folder.
- *\$\frameworksDir\}* The path (as file path) of the <code>[OXYGEN DIR]/frameworksdirectory</code>.
- \$\(\frac{pd}{d}\)\) Current project folder as file path. Usually the current folder selected in the **Project** View.
- \$\(\frac{\partial}{\partial}\) oxygen InstallDir\) Oxygen XML Developer plugin installation folder as file path.
- *\${homeDir}* The path (as file path) of the user home folder.
- *\${pn}* Current project name.
- \$\(\sigma\) Value of the \(\nabla R_NAME\) environment variable. The environment variables are managed by the operating system. If you are looking for Java System Properties, use the \$\(\sqrt{system}(var.name) \) editor variable.
- \$\(\frac{\system(var.name)}{\system}\)\) Value of the var. name Java System Property. The Java system properties can be specified in the command line arguments of the Java runtime as -Dvar.name=var.value. If you are looking for operating system environment variables, use the \$\{env(VAR_NAME)\}\) editor variable instead.
- \$\{date(pattern)\}\ Current date. The allowed patterns are equivalent to the ones in the \(Java \) SimpleDateFormat class. **Example:** yyyy-MM-dd;

Note: This editor variable supports both the xs:date and xs:datetime parameters. For details about xs:date, go to http://www.w3.org/TR/xmlschema-2/#date. For details about xs:datetime, go to http://www.w3.org/TR/xmlschema-2/#dateTime.

Document Templates Preferences

Oxygen XML Developer plugin provides a selection of document templates that make it easier to create new documents in a variety of formats. The list of available templates is presented when you create a new document. You can also create your own templates and share them with others. You can add your custom file templates by creating template files in a directory and adding that directory to the list of template directories that Oxygen XML Developer plugin uses. To add a template directory, open the **Preferences** dialog box and go to **Editor** > **Templates** > **Document Templates**.

You can add new document template location folders and manage existing ones. You can also alter the order in which Oxygen XML Developer plugin looks into these directories by using the **Up** and **Down** buttons.

Spell Check Preferences

Oxygen XML Developer plugin provides support for spell checking in the *text* editing mode. To configure the **Spell Check** options, *open the* **Preferences** *dialog box* and go to **Editor** > **Spell Check**.

The following options are available:

- **Spell checking engine** Oxygen XML Developer plugin ships with two spell check engines, *Hunspell* and *Java spell checker*. The two engines come with different dictionaries. When you select an engine here, the list of languages in the **Default language** option changes based on the available dictionaries for the engine you have chosen.
- Automatic Spell Check This option is disabled by default. When enabled, Oxygen XML Developer plugin automatically checks the spelling as you type and highlights misspelled words in the document.
 - Select editors You can select which editors (and therefore which file types) will be automatically spelled checked. File types for which automatic spell check is generally not useful, such as CSS and DTD, are excluded by default.

Language Options Section

- **Default language** The default language list allows you to choose the language used by the spell check engine when the language is not specified in the source file. You can *add additional dictionaries to the spell check engines*.
- Use "lang" and "xml:lang" attributes When this option is selected, the contents of an element with one of the lang or xml:lang attributes is checked in that language. When this option is enabled, choose between the following two options for instances when these attributes are missing:
 - Use the default language If the lang and xml:lang attributes are missing, the selection in the **Default** language list is used.
 - **Do not check** If the lang and xml:lang attributes are missing, the element is not checked.

XML Spell Checking in Section

You can choose to check the spelling inside the following XML items:

- Comments
- Attribute values
- Text
- CDATA

Options Section

- **Check capitalization** When selected, the spell checker reports capitalization errors (for example, a word that starts with lowercase after *etc.* or *i.e.*.
- **Check punctuation** When selected, the spell checker checks punctuation. Misplaced white space and unusual sequences, like a period following a comma, are highlighted as errors.
- **Ignore mixed case words** When selected, the spell checker does not check words containing mixed case characters (for example, *SpellChecker*).
- **Ignore acronyms** Available only for the *Hunspell spell checker*. When selected, acronyms are not reported as errors.
- **Ignore words with digits** When selected, the spell checker does not check words containing digits (for example, *b2b*).
- Ignore duplicates When selected, the spell checker does not signal two successive identical words as an error.
- **Ignore URL** When selected, the spell checker ignores words looking like URLs or file names (for example, www.oxygenxml.com or c:\boot.ini).

- Allow compounds words When selected, all words formed by concatenating two legal words with a hyphen
 (hyphenated compounds) are accepted. If recognized by the language, two words concatenated without hyphen
 (closed compounds) are also accepted.
- Allow general prefixes Available only for the Java spell checker. When selected, a word formed by concatenating
 a recognized prefix and a legal word is accepted. For example if mini- is a registered prefix, the spell check engine
 accepts the word mini-computer.
- **Allow file extensions** When selected, the spell checker accepts any word ending with recognized file extensions (for example, *myfile.txt* or *index.html*).

Ignore Elements Section

You can use the **Add** and **Remove** buttons to configure a list of element names or XPath expressions to be ignored by the spell checker. The following restricted set of XPath expressions are supported:

- '/' and '//' separators
- '*' wildcard

An example of an allowed XPath expression is: /a/*/b.

To change the color used by the spell check engine to highlight spelling errors, go to **Window** (**Eclipse** on Mac OSX) and choose **Preferences**. Then go to **General** > **Editors** > **Text Editors** > **Annotations** > **Spell Check Annotation**.

Spell Check Dictionaries Preferences

To set the Dictionaries preferences, *open the Preferences dialog box* and go to **Editor** > **Spell Check** > **Dictionaries**. This page allows you to configure the dictionaries and term lists (.tdi files) that Oxygen XML Developer plugin uses and to choose where to save new learned words.

The following options are valid when Oxygen XML Developer plugin uses the Hunspell spell checking engine:

- **Dictionaries and term lists default folder** Displays the default location where the dictionaries and term lists that Oxygen XML Developer plugin uses are stored.
- **Include dictionaries and term list from** Selecting this option allows you to specify a location where you have stored dictionaries and term lists that you want to include, along with the default ones.

Note: The spell checker takes into account dictionaries and term lists collected both from the default and custom locations and multiple dictionaries and term lists from the same language are merged into generic ones (for example, en_UK.dic from the default location is merged with en_US.dic from a custom location, and the result is that a third file is created for a generic dictionary called en.dic). However, if there is already a generic dictionary (for example, en.dic) saved in either the default or custom location, the other specific dictionaries (for example, en_UK.dic and en_US.dic) will not be merged and the existing generic dictionary will simply be used. Also, if the additional location contains a file with the same name as one from the default location, the file in the additional location takes precedence over the file from the default location.

- Save learned words in the following location Specifies the target where the newly learned words are saved. By default, the target is the application preferences folder, but you can also choose a custom location.
- **Delete learned words** Opens the list of learned words, allowing you to select the items you want to remove, without deleting the dictionaries and term lists.

Document Checking Preferences

To configure the **Document Checking** options, *open the Preferences dialog box* and go to **Editor** > **Document Checking**. This preferences page contains preferences for configuring how a document is checked for both well-formedness errors and validation errors.

The following options are available:

• **Maximum number of validation highlights** - If validation generates more errors than the number from this option only the first errors up to this number are highlighted in editor panel and on stripe that is displayed at right side of editor panel. This option is applied both for *automatic validation* and *manual validation*.

- Clear validation markers on close If this option is selected all the error markers added in the **Problems** view for that document are removed when a document edited with the Oxygen XML Developer plugin plugin is closed.
- Enable automatic validation Validation of edited document is executed in background as the document is modified by editing in Oxygen XML Developer plugin.
- Delay after the last key event (s) The period of keyboard inactivity which starts a new validation (in seconds).

Mark Occurrences Preferences

To configure the Mark Occurrences options, open the Preferences dialog box and go to Editor > Mark Occurrences:

The following preferences are available in this preferences page:

- XML files Activates the *Highlight IDs Occurrences* feature in XML files.
- XSLT files Activates the *Highlight Component Occurrences* feature in XSLT files.
- XML Schema files and WSDL files Activates the Highlight Component Occurrences feature in XSD and WSDL files
- RNG files Activates the highlight component occurrences feature in RNG files.
- Schematron files Activates the *Highlight Component Occurrences* feature in Schematron files.
- **Declaration highlight color** Color used to highlight the component declaration.
- **Reference highlight color** Color used to highlight component references.

Custom Validation Engines Preferences

To configure the options for *Custom Validation Engines*, *open the Preferences dialog box* and go to **Editor** > **Custom Validations**.

If you want to add a new custom validation tool or edit the properties of an exiting one you can use the **Custom Validator** dialog box displayed by pressing the **New** button or the **Edit** button.

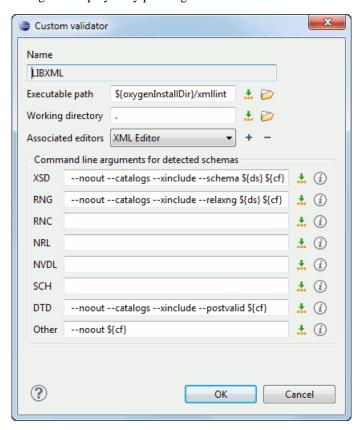

Figure 260: Edit a Custom Validator

The configurable parameters of a custom validator are as follows:

- Name Name of the custom validation engine that will be displayed in the 🗹 Validation toolbar drop-down menu
- **Executable path** Path to the executable file of the custom validation tool. You can insert *editor variables*, such as \$\{\text{home}\}, \{\text{pd}\}, \\$\{\text{oxygenInstallDir}\}.
- Working directory The working directory of the custom validation tool.
- **Associated editors** The editors that can perform validation with the external tool (XML editor, XSL editor, XSD editor, etc.)
- Command line arguments for detected schemas Command line arguments used in the commands that validate the current edited file against different types of schema (W3C XML Schema, Relax NG full syntax, Relax NG compact syntax, NVDL, Schematron, DTD, etc.) The arguments can include any custom switch (like -rng) and the following editor variables:
 - \$\(\sigma file \) as file path, that is the absolute file path of the current edited document.
 - \${currentFileURL} Current file as URL, that is the absolute file path of the current edited document represented as URL.
 - $\${ds}$ The path of the detected schema as a local file path for the current validated XML document.
 - \$\(\frac{1}{3}\)dsu] The path of the detected schema as an URL for the current validated XML document.

Increasing the stack size for validation engines

To prevent the appearance of a *StackOverflowException*, use one of the following methods:

- Use the **com.oxygenxml.stack.size.validation.threads** property to increase the size of the stack for validation engines. The value of this property is specified in bytes. For example, to set a value of one megabyte specify 1x1024x1024=1048576.
- Increase the value of the **-Xss** parameter.

Note: Increasing the value of the **-Xss** parameter affects all the threads of the application.

Fonts Preferences

Oxygen XML Developer plugin allows you to choose the fonts to be used in the **Text**, **Design**, and **Grid** editor modes. To configure the font options, *open the Preferences dialog box* and go to **Fonts**.

The following options are available:

Text

This option allows you to choose the font used in **Text** mode. There are two options available:

- Map to text font Uses the same font for the basic text editor as the one set in General > Appearance > Colors and Fonts.
- Customize Allows you to choose a specific font.

Schema default font

This option allows you to choose the font to be used in:

- The **Design** mode of the *XML Schema editor*.
- Images with schema diagram fragments that are included in the HTML documentation generated from an XML Schema.

Note: You must restart the application for your changes to be applied.

Network Connection Settings Preferences

This section presents the options available in the **Network Connection Settings** preferences pages.

HTTP(S)/WebDAV Preferences

To set the **HTTP(S)/WebDAV** preferences, *open the Preferences dialog box* and go to **Network Connection Settings** > **HTTP(S)/WebDAV**. The following options are available:

- Enable the HTTP(S)/WebDAV Protocols Activates the HTTP(S)/WebDAV protocols bundled with Oxygen XML Developer plugin. Any adjustment to this option requires a restart of the application.
- Internal Apache HttpClient Version Oxygen XML Developer plugin uses the Apache HttpClient to establish connections to HTTP servers. To enable Oxygen XML Developer plugin to benefit from particular sets of features provided by different versions, you may choose between v3 and v4.
 - =

Note: For a full list of features, go to *http://hc.apache.org/httpclient-3.x/* and *http://hc.apache.org/httpcomponents-client-ga/*

- Maximum number of simultaneous connections per host Defines the maximum number of simultaneous connections established by the application with a distinct host. Servers might consider multiple connections opened from the same source to be a **Denial of Service** attack. You can avoid that by lowering the value of this option.
 - **Note:** This option accepts a minimum value of 5.
- **Read Timeout (seconds)** The period in seconds after which the application considers that an HTTP server is unreachable if it does not receive any response to a request sent to that server.
- Enable HTTP 'Expect: 100-continue ' handshake for HTTP/1.1 protocol Activates Expect: 100-Continue handshake. The purpose of the Expect: 100-Continue handshake is to allow a client that is sending a request message with a request body to determine if the origin server is willing to accept the request (based on the request headers) before the client sends the request body. The use of the Expect: 100-continue handshake can result in noticeable performance improvement when working with databases. The Expect: 100-continue handshake should be used with caution, as it may cause problems with HTTP servers and proxies that do not support the HTTP/1.1 protocol.
- Use the 'Content-Type' header field to determine the content type When checked, tries to determine a resource type using the Content-Type header field. This header indicates the *Internet media type* of the message content, consisting of a type and subtype, for example:

```
Content-Type: text/xml
```

When unchecked, the resource type is determined by analyzing its extension. For example, a file ending in .xml is considered to be an XML file.

- Automatic retry on recoverable error If enabled, if an HTTP error occurs when communicates with a server via HTTP, for example sending / receiving a SOAP request / response to / from a Web services server, and the error is recoverable, tries to send again the request to the server.
- Automatically accept a security certificate, even if invalid When enabled, the HTTPS connections that Oxygen XML Developer plugin attempts to establish will accept all security certificates, even if they are invalid.
 - [] Important: By accepting an invalid certificate, you accept at your own risk a potential security threat, since you cannot verify the integrity of the certificate's issuer.
- Encryption protocols (SVN Client only) this option is available only if you run the application with Java 1.6 or older. Sets a specific encryption protocol used when a repository is accessed through HTTPS protocol. You can choose one of the following values:
 - SSLv3, TLSv1 (default value);
 - SSLv3 only;
 - · TLSv1 only.
- Lock WebDAV files on open If checked, the files opened through WebDAV are locked on the server so that they cannot be edited by other users while the lock placed by the current user still exists on the server.

(S)FTP Preferences

To configure the **(S)FTP** options, *open the Preferences dialog box* and go to **Network Connection Settings** > **(S)FTP**. You can customize the following options:

Figure 261: The (S)FTP Configuration Preferences Panel

- Encoding for FTP control connection The encoding used to communicate with FTP servers: either ISO-8859-1 or UTF-8. If the server supports the UTF-8 encoding Oxygen XML Developer plugin will use it for communication. Otherwise it will use ISO-8859-1.
- **Public known hosts file** File containing the list of all SSH server host keys that you have determined are accurate. The default value is \${homeDir}/.ssh/known hosts.
- **Private key file** The path to the file containing the private key used for the private key method of authentication of the secure FTP (SFTP) protocol.
- Passphrase The passphrase used for the private key method of authentication of the secure FTP (SFTP) protocol.
- Show SFTP certificate warning dialog If checked, a warning dialog box will be displayed each time when the authenticity of the host cannot be established.

Trusted Hosts Preferences

Holds a list with domains that have been marked as trusted by the user. Oxygen XML Developer plugin will connect to these hosts without requesting user confirmation.

To configure the **Trusted Hosts** options, *open the Preferences dialog box* and go to **Network Connection Settings** > **Trusted Hosts**. The following options are available:

- New Allows you to manually add a new entry in the list of trusted hosts.
- **Delete** Allows you to remove an entry from the trusted hosts list.

Scenarios Management Preferences

To configure Scenarios Management options, *open the Preferences dialog box* and go to **Scenarios Management**. This allows you to share the global transformation scenarios with other users by exporting them to an external file that can also be imported in this preferences panel.

Figure 262: The Scenarios Management Preferences Panel

The actions available in this panel are as follows:

• Import Global Transformation Scenarios - Allows you to import all global-level transformation scenarios from a file created with the export scenario action. The names of the imported scenarios will appear in the Configure Transformation Scenario dialog box followed by (import). This way there are no scenario name conflicts.

- Export Global Transformation Scenarios Allows you to export all global transformation scenarios available in the Configure Transformation Scenario dialog box.
- Import Global Validation Scenarios Allows you to import all global-level scenarios from a file created with the export scenario action. The names of the imported scenarios will appear in the Configure Validation Scenario dialog box followed by (import). This way there are no scenario name conflicts.
- Export Global Validation Scenarios Allows you to export all global validation scenarios available in the Configure Validation Scenario dialog box.

View Preferences

To configure the view options, open the Preferences dialog box and go to Views and contains the following preferences:

- Fixed width console If checked, a line in the Console view will be hard wrapped after the maximum numbers of characters allowed on a line.
- **Limit console output** If checked, the content of the **Console** view will be limited to a configurable number of characters.
- Console buffer Specifies the maximum number of characters that can be written in the Console view.
- **Tab width** Specifies the number of spaces used for depicting a tab character.

XML Preferences

This section describes the panels that contain the user preferences related with XML.

XML Catalog Preferences

To configure the XML Catalog options, open the Preferences dialog box and go to XML > XML Catalog.

The following options are available:

• **Prefer** - the prefer setting determines whether public identifiers specified in the catalog are used in favor of system identifiers supplied in the document. Suppose you have an entity in your document for which both a public identifier and a system identifier has been specified, and the catalog only contains a mapping for the public identifier (for example, a matching public catalog entry). If **public** is selected, the URI supplied in the matching public catalog entry is used. If **system** is selected, the system identifier in the document is used.

Note: If the catalog contained a matching system catalog entry giving a mapping for the system identifier, that mapping would have been used, the public identifier would never have been considered, and the setting of override would have been irrelevant.

Generally, the purpose of catalogs is to override the system identifiers in XML documents, so **Prefer** should usually be **public** in your catalogs.

- When using catalogs it is sometimes useful to see what catalog files are parsed, if they are valid or not, and what
 identifiers are resolved by the catalogs. The **Verbosity** option selects the detail level of such logging messages of
 the XML catalog resolver that will be displayed in the **Catalogs** view at the bottom of the window:
 - None No message is displayed by the catalog resolver when it tries to resolve a URI reference, a SYSTEM one or a PUBLIC one with the XML catalogs specified in this panel.
 - Unresolved entities Only the logging messages that track the failed attempts to resolve references are displayed.
 - All messages The messages of both failed attempts and successful ones are displayed.
- If **Resolve schema locations also through system mappings** is enabled, Oxygen XML Developer plugin analyzes both *uri* and *system* mappings in order to resolve the location of schema.
 - Ε,

Note: This option is not applicable for DTD schemas since the public and system catalog mappings are always considered.

• If **Process namespaces through URI mappings for XML Schema** is selected then the target namespace of the imported XML Schemas is resolved through the *uri* mappings. The namespace is taken into account only when the schema specified in the *schemaLocation* attribute was not resolved successfully.

• If the **Use default catalog** option is checked the first XML catalog which Oxygen XML Developer plugin will use to resolve references at document validation and transformation will be a default built-in catalog. This catalog maps such references to the built-in local copies of the schemas of the Oxygen XML Developer plugin frameworks (DocBook, DITA, TEI, XHTML, SVG, etc.)

You can also add or configure catalogs at framework level from the **Catalogs** tab in the **Document Type** configuration dialog box.

When you add, delete or edit an XML catalog to / from the list, reopen the currently edited files which use the modified catalog or run *the Validate action* so that the XML catalog changes take full effect.

XML Parser Preferences

To configure the XML Parser options, open the Preferences dialog box and go to XML > XML Parser.

The configurable options of the built-in XML parser are as follows:

- Enable parser caching (validation and content completion) Enables re-use of internal models when validating and provides content completion in opened XML files which reference the same schemas (grammars) like DTD, XML Schema, RelaxNG.
- Ignore the DTD for validation if a schema is specified Forces validation against a referenced schema (W3C XML Schema, Relax NG schema) even if the document includes also a DTD DOCTYPE declaration. This option is useful when the DTD declaration is used only to declare DTD entities and the schema reference is used for validation against a W3C XML Schema or a Relax NG schema.

Note: Schematron schemas are treated as additional schemas. The validation of a document associated with a DTD and referencing a Schematron schema is executed against both the DTD and the Schematron schema, regardless of the value of the **Ignore the DTD for validation if a schema is specified** option.

- Enable XInclude processing Enables XInclude processing. If checked, the XInclude support in Oxygen XML Developer plugin is turned on for validation and transformation of XML documents.
- Base URI fix-up According to the specification for XInclude, processors must add an xml:base attribute to elements included from locations with a different base URI. Without these attributes, the resulting infoset information would be incorrect.

Unfortunately, these attributes make XInclude processing not transparent to Schema validation. One solution to this is to modify your schema to allow xml:base attributes to appear on elements that might be included from different base URIs.

If the addition of xml:base and or xml:lang is undesired by your application, you can disable base URI fix-up.

- Language fix-up The processor will preserve language information on a top-level included element by adding an xml:lang attribute if its include parent has a different [language] property. If the addition of xml:lang is undesired by your application, you can disable the language fix-up.
- DTD post-validation Enable this option to validate an XML file against the associated DTD, after all the content merged to the current XML file using XInclude was resolved. If you disable this option, the current XML file is validated against the associated DTD before all the content merged to the current XML file using XInclude is resolved.

XML Schema Preferences

To configure the XML Schema options, *open the Preferences dialog box* and go to XML > XML Parser > XML Schema.

This preferences page allows you to configure the following options:

• **Default XML Schema version** - Allows you to select the version of W3C XML Schema: XML Schema **1.0** or XML Schema **1.1**.

Note: You are also able to set the XML Schema version using the **Customize** option in *New dialog box*.

 Default XML Schema validation engine - Allows you to set the default XML Schema validation engine either to Xerces or Saxon EE.

Xerces validation features

- Enable full schema constraint checking (http://apache.org/xml/features/validation/schema-full-checking) Sets the *schema-full-checking* feature to true. This enables a validation of the parsed XML document against a schema (W3C XML Schema or DTD) while the document is parsed.
- Enable honour all schema location feature (http://apache.org/xml/features/honour-all-schema-location) Sets the honour-all-schema-location feature to true. All the files that declare W3C XML Schema components from the same namespace are used to compose the validation model. In case this option is disabled, only the first W3C XML Schema file that is encountered in the XML Schema import tree is taken into account.
- Enable full XPath 2.0 in assertions and alternative types (http://apache.org/xml/features/validation/cta-full-xpath-checking) When enabled (default value), you can use the full XPath support in assertions and alternative types. Otherwise, only the XPath support offered by the Xerces engine is available.
- Assertions can see comments and processing instructions
 (http://apache.org/xml/features/validation/assert-comments-and-pi-checking) Controls whether comments and processing instructions are visible to the XPath expression used for defining an assertion in XSD 1.1.

Saxon validation features

- Multiple schema imports Forces xs:import to fetch the referenced schema document. By default, the xs:import
 fetches the document only if no schema document for the given namespace has already been loaded. With this option
 in effect, the referenced schema document is loaded unless the absolute URI is the same as a schema document
 already loaded.
- Assertions can see comments and processing instructions Controls whether comments and processing instructions
 are visible to the XPath expression used to define an assertion. By default (unlike Saxon 9.3), they are not made
 visible.

Relax NG Preferences

To configure the Relax NG options, open the Preferences dialog box and go to XML > XML Parser > Relax NG.

The following options are available in this page:

- Check feasibly valid Checks whether Relax NG documents can be transformed into valid documents by inserting any number of attributes and child elements anywhere in the tree.
 - Note: Enabling this option disables the Check ID/IDREF option.
- Check ID/IDREF Checks the ID/IDREF matches when a Relax NG document is validated.
- Add default attribute values Default values are given to the attributes of documents validated using Relax NG. These values are defined in the Relax NG schema.

Schematron Preferences

To configure the **Schematron** options, *open the Preferences dialog box* and go to **XML** > **XML Parser** > **Schematron**.

The following options are available in this preferences page:

ISO Schematron Section

- Optimize (visit-no-attributes) If your ISO Schematron assertion tests do not contain the attributes axis, you should check this option for faster ISO Schematron validation.
- Allow foreign elements (allow-foreign) Enables support for allow-foreign on ISO Schematron. This option is used to pass non-Schematron elements to the generated stylesheet.
- Use Saxon EE (schema aware) for xslt2/xslt3 query language binding When enabled, Saxon EE is used for xslt2/xslt3 query binding. If this option is disabled, Saxon PE is used.

- Enable Schematron Quick Fixes (SQF) support Allows you to enable or disable the support for quick fixes in Schematron files. This option is enabled by default.
- Embedded rules query language binding You can control the query language binding used by the ISO Schematron embedded rules. You can choose between: xslt1, xslt2, or xslt3.

Note: To control the query language binding for standalone ISO Schematron, you need to set the query language to be used with a queryBinding attribute on the schema root element.

Schematron 1.5 Section

• **XPath Version** - Allows you to select the version of XPath for the expressions that are allowed in Schematron assertion tests. You can choose between: **1.0**, **2.0**, or **3.0**. This option is applied in both standalone Schematron 1.5 schemas and embedded Schematron 1.5 rules.

XML Instances Generator Preferences

To configure the XML Instances Generator options, *open the Preferences dialog box* and go to XML > XML Instances Generator. It sets the default parameters of the Generate Sample XML Files tool that is available on the Tools menu.

The options of the tool that generates XML instance documents based on a W3C XML Schema are the following:

- Generate optional elements If checked, the elements declared optional in the schema will be generated in the XML instance.
- **Generate optional attributes** If checked, the attributes declared optional in the schema will be generated in the XML instance.
- Values of elements and attributes Specifies what values are generated in elements and attributes of the XML instance. It can have one of the values:
 - None No values for the generated elements and attributes.
 - **Default** The value is the element name or attribute name.
 - Random A random value.
- Preferred number of repetitions If the values set here is greater than maxOccurs, then the maxOccurs is used.
- **Maximum recursivity level** For recursive type definitions this parameter specifies the number of levels of recursive elements inserted in the parent element with the same name.
- Type alternative strategy Specifies how the element type alternatives are generated in the XML instance:
 - **First** The first element type alternative whose XPath condition is true is used.
 - Random A random element type alternative whose XPath condition is true is used.
 - =
- Note: If no XPath condition is true, the default element type alternative is used.
- Note: To evaluate an XPath expression, either the values of the attributes defined in the **Options** tab of the **XML Instance Generator** dialog box, or the attributes values defined in the XML Schema are used.
- Choice strategy For choice element models specifies what choice will be generated in the XML instance:
 - **First** The first choice is selected from the choice definition and an instance of that choice is generated in the XML instance document.
 - Random A random choice is selected from the choice definition and an instance of that will be generated.
- **Generate the other options as comments** If checked, the other options of the choice element model (the options which are not selected) will be generated inside an XML comment in the XML instance.
- Use incremental attribute / element names as default If checked, the value of an element or attribute starts with the name of that element or attribute. For example, for an a element the generated values are: a1, a2, a3, and so on. If not checked, the value is the name of the type of that element / attribute (for example: string, decimal, etc.)
- Maximum length The maximum length of string values generated for elements and attributes.

• **Discard optional elements after nested level** - The optional elements that exceed the specified nested level are discarded. This option is useful for limiting deeply nested element definitions that can quickly result in very large XML documents.

XProc Engines Preferences

Oxygen XML Developer plugin comes with a built-in XProc engine called *Calabash*. You can add or configure external XProc engines by using the **XProc Engines** preferences page. *Open the Preferences dialog box* and go to **XML** > **XProc**.

When **Show XProc messages** is selected all messages emitted by the XProc processor during a transformation will be presented in the results view.

To add an external engine click the **New** button. To configure an existing engine, click the **Edit** button. This opens the **Custom Engine** dialog box that allows you to configure an external engine.

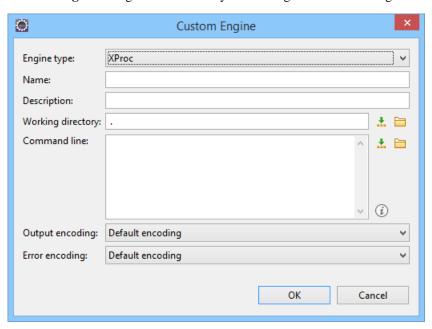

Figure 263: Creating an XProc external engine

The following options can be configure in this dialog box:

- Name The value of this field will be displayed in the XProc transformation scenario and in the command line that will start it.
- **Description** A textual description that will appear as a tooltip where the XProc engine will be used.
- **Working directory** The working directory for resolving relative paths. You can use *built-in editor variables* and *custom editor variables* for the path.
- Command line The command line that will run the XProc engine as an external process. You can use *built-in* editor variables and custom editor variables for parametrizing a file path.
- **Output encoding** The encoding for the output stream of the XProc engine, used for reading and displaying the output messages.
- **Error encoding** The encoding for the error stream of the XProc engine, used for reading and displaying the messages from the error stream.
- Note: You can configure the built-in Saxon processor using the saxon.config file. For further details about configuring this file go to

http://www.saxonica.com/documentation9.5/index.html#!configuration/configuration-file. You can configure the built-in Calabash processor by using the calabash.config file. These files are located in [OXYGEN_DIR]\lib\xproc\calabash\lib. If they do not exist, you have to create them.

XSLT-FO-XQuery Preferences

To configure the **XSLT/FO/XQuery** options, *open the Preferences dialog box* and go to **XML** > **XSLT/FO/XQuery**. This panel contains only the most generic options for working with XSLT / XSL-FO / XQuery processors. The more specific options are grouped in other panels linked as child nodes of this panel in the tree of this **Preferences** page.

There is only one generic option available:

Create transformation temporary files in system temporary directory - It should be selected only when the temporary files necessary for performing transformations are created in the same folder as the source of the transformation (the default behavior, when this option is not selected) and this breaks the transformation. An example of breaking the transformation is when the transformation processes all the files located in the same folder as the source of the transformation, which will include the temporary files, and the result is incorrect or the transformation fails due to this fact.

XSLT Preferences

To configure the **XSLT** options, *open the Preferences dialog box* and go to **XML** > **XSLT/FO/XQuery** > **XSLT**.

Oxygen XML Developer plugin gives you the possibility to use an XSLT transformer implemented in Java (other than the XSLT transformers that come bundled with Oxygen XML Developer plugin). To use a different XSLT transformer, specify the name of the transformer factory class. Oxygen XML Developer plugin sets this transformer factory class as the value of the Java property javax.xml.transform.TransformerFactory.

You can customize the following XSLT preferences:

- Value Allows you to set the value of the TransformerFactory Java class.
- XSLT 1.0 Validate with Allows you to set the XSLT engine used for validation of XSLT 1.0 documents.
- XSLT 2.0 Validate with Allows you to set the XSLT Engine used for validation of XSLT 2.0 documents.
- XSLT 3.0 Validate with Allows you to set the XSLT Engine used for validation of XSLT 3.0 documents.

Note: Saxon-HE does not implement any XSLT 3.0 features. Saxon-PE implements a selection of XSLT 3.0 (and XPath 3.0) features, with the exception of schema-awareness and streaming. Saxon-EE implements additional features relating to streaming (processing of a source document without constructing a tree in memory. For further details about XSLT 3.0 conformance, go to http://www.saxonica.com/documentation/index.html#!conformance/xslt30.

Saxon6 Preferences

To configure the Saxon 6 options, *open the Preferences dialog box* and go to XML > XSLT/FO/XQuery > XSLT > Saxon > Saxon 6.

Saxon6
Line numbering ("-l")
Disable calls on extension functions ("-noext")
Handling of recoverable stylesheet errors
Recover silently ("-w0")
Recover with warnings ("-w1")
Signal the error and do not attempt recovery ("-w2")

Figure 264: The Saxon 6 XSLT Preferences Panel

The built-in Saxon 6 XSLT processor can be configured with the following options:

- Line numbering Specifies whether line numbers are maintained and reported in error messages for the XML source
 document.
- **Disable calls on extension functions** If enabled, external functions called is disallowed. Checking this is recommended in an environment where untrusted stylesheets may be executed. Also disables user-defined extension elements, together with the writing of multiple output files, all of which carry similar security risks.

- **Handling of recoverable stylesheet errors** Allows you to choose how dynamic errors are handled. One of the following options can be selected:
 - **recover silently** Continue processing without reporting the error.
 - recover with warnings Issue a warning but continue processing.
 - signal the error and do not attempt recovery Issue an error and stop processing.

Saxon-HE/PE/EE Preferences

To configure the Saxon HE/PE/EE options, *open the Preferences dialog box* and go to XML > XSLT/FO/XQuery > XSLT > Saxon > Saxon HE/PE/EE.

Oxygen XML Developer plugin allows you to configure the following XSLT options for the Saxon 9.6.0.7 Home Edition (HE), Professional Edition (PE), and Enterprise Edition (EE):

- Use a configuration file ("-config") Sets a Saxon 9.6.0.7 configuration file that is executed for XSLT transformation and validation processes.
- Version warnings ("-versmsg") Warns you when the transformation is applied to an XSLT 1.0 stylesheet.
- Line numbering ("-l") Error line numbers are included in the output messages.
- **Debugger trace into XPath expressions (applies to debugging sessions)** Instructs the *XSLT Debugger* XSLT Debugger to step into XPath expressions.
- Expand attributes defaults ("-expand") Specifies whether or not the attributes defined in the associated DTD or XML Schema are expanded in the output of the transformation you are executing.
- DTD validation of the source ("-dtd") The following options are available:
 - On Requests DTD validation of the source file and of any files read using the document () function.
 - Off (default setting) Suppresses DTD validation.
 - **Recover** Performs DTD validation but treats the errors as non-fatal.
 - Ē,

Note: Any external DTD is likely to be read even if not used for validation, since DTDs can contain definitions of entities.

- **Recoverable errors** ("-warnings") Policy for handling recoverable errors in the stylesheet: Allows you to choose how dynamic errors are handled. One of the following options can be selected:
 - **Recover silently ("silent")** Continues processing without reporting the error.
 - Recover with warnings ("recover") (default setting) Issues a warning but continues processing.
 - Signal the error and do not attempt recovery ("fatal") Issues an error and stops processing.
- Strip whitespaces ("-strip") Strip whitespaces feature can be one of the following three options:
 - All ("all") Strips all whitespace text nodes from source documents before any further processing, regardless of any xsl:strip-space declarations in the stylesheet, or any xml:space attributes in the source document.
 - Ignorable ("ignorable") Strips all ignorable whitespace text nodes from source documents before any further processing, regardless of any xsl:strip-space declarations in the stylesheet, or any xml:space attributes in the source document. Whitespace text nodes are ignorable if they appear in elements defined in the DTD or schema as having element-only content.
 - **None** ("**none**") default setting. No whitespaces are stripped before further processing. However, whitespace are stripped if this is specified in the stylesheet using xsl:strip-space.
- Optimization level ("-opt") Set the optimization level. The value is an integer in the range 0 (no optimization) to 10 (full optimization). This option allows optimization to be suppressed when reducing the compiling time is important, optimization conflicts with debugging, or optimization causes extension functions with side-effects to behave unpredictably.

The advanced options available only in Saxon Professional Edition (PE) and Enterprise Edition (EE) are:

• Allow calls on extension functions ("-ext") - If checked, the stylesheet is allowed to call external Java functions. This does not affect calls on integrated extension functions, including Saxon and EXSLT extension functions. This

option is useful when loading an untrusted stylesheet, such as from a remote site using an http://[URL]. It ensures that the stylesheet cannot call arbitrary Java methods and thus gain privileged access to resources on your machine.

• **Register Saxon-CE extension functions and instructions** - Registers the Saxon-CE extension functions and instructions when compiling a stylesheet using the Saxon 9.6.0.7 processors.

Note: Saxon-CE, being JavaScript-based, was designed to run inside a web browser. This means that you will use Oxygen XML Developer plugin only for developing the Saxon-CE stylesheet, leaving the execution part to a web browser. See more details about *executing such a stylesheet on Saxonica's website*.

The advanced options available only in Saxon Enterprise Edition (EE) are:

- **XML Schema version** Use this option to change the default XML Schema version. To change the default XML Schema version, *open the Preferences dialog box* and go to **XML** > **XML Parser** > **XML Schema**.
 - Note: This option is available when you configure the Saxon EE advanced options from a transformation scenario.
- Validation of the source file ("-val") Requests schema-based validation of the source file and of any files read using the document () or similar functions. It can have the following values:
 - Schema validation ("strict") This mode requires an XML Schema and specifies that the source documents should be parsed with strict schema-validation enabled.
 - Lax schema validation ("lax") If an XML Schema is provided, this mode enables parsing the source documents with schema-validation enabled but the validation will not fail if, for example, element declarations are not found.
 - Disable schema validation This specifies that the source documents should be parsed with schema-validation disabled.
- Validation errors in the results tree treated as warnings ("-outval") Normally, if validation of result documents is requested, a validation error is fatal. Enabling this option causes such validation failures to be treated as warnings.
- Write comments for non-fatal validation errors of the result document The validation messages are written (where possible) as a comment in the result document itself.
- **Generate bytecode** ("--generateByteCode:(on|off)") If you enable this option, Saxon-EE attempts to generate Java bytecode for evaluation of parts of a query or stylesheet that are amenable to such an action. For further details regarding this option, go to http://www.saxonica.com/documentation9.5/index.html#!javadoc.

Saxon HE/PE/EE Advanced Preferences

To configure the **Saxon HE/PE/EE Advanced** preferences, *open the Preferences dialog box* and go to **XML** > **XSLT/FO/XQuery** > **XSLT** > **Saxon** > **Saxon HE/PE/EE** > **Advanced**.

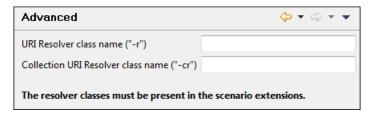

Figure 265: The Saxon HE/PE/EE XSLT Advanced Preferences Panel

You can configure the following advanced XSLT options for the Saxon 9.6.0.7 transformer (all three editions: Home Edition, Professional Edition, Enterprise Edition):

- URI Resolver class name ("-r") Specifies a custom implementation for the URI resolver used by the XSLT Saxon 9.6.0.7 transformer (the -r option when run from the command line). The class name must be fully specified and the corresponding jar or class extension must be configured from the dialog box for configuring the XSLT extension for the particular transformation scenario.
- Collection URI Resolver class name ("-cr") Specifies a custom implementation for the Collection URI resolver used by the XSLT Saxon 9.6.0.7 transformer (the -cr option when run from the command line). The class name must

be fully specified and the corresponding jar or class extension must be configured from *the dialog box for configuring the XSLT extension* for the particular transformation scenario.

XSLTProc Preferences

To configure **XSLTProc** options, *open the Preferences dialog box* and go to **XML** > **XSLT/FO/XQuery** > **XSLT** > **XSLTProc**.

The options of the XSLTProc processor are the same as the ones available in the command line:

- **Enable XInclude processing** If checked, XInclude references will be resolved when XSLTProc is used as transformer in *XSLT transformation scenarios*.
- Skip loading the document's DTD If checked, the DTD specified in the DOCTYPE declaration will not be loaded.
- **Do not apply default attributes from document's DTD** If checked, the default attributes declared in the DTD and not specified in the document are not included in the transformed document.
- Do not use Internet to fetch DTD's, entities or docs If checked, the remote references to DTD's and entities are not followed.
- **Maximum depth in templates stack** If this limit of maximum templates depth is reached the transformation ends with an error.
- Verbosity If checked, the transformation will output detailed status messages about the transformation process in the Warnings view.
- Show version of libxml and libxslt used If checked, Oxygen XML Developer plugin will display in the Warnings view the version of the libxml and libxslt libraries invoked by XSLTProc.
- **Show time information** If checked, the **Warnings** view will display the time necessary for running the transformation.
- **Show debug information** If checked, the **Warnings** view will display debug information about what templates are matched, parameter values, and so on.
- Show all documents loaded during processing If checked, Oxygen XML Developer plugin will display in the Warnings view the URL of all the files loaded during transformation.
- Show profile information If checked, Oxygen XML Developer plugin will display in the Warnings view a table with all the matched templates, and for each template will display: the match XPath expression, the template name, the number of template modes, the number of calls, the execution time.
- Show the list of registered extensions If checked, Oxygen XML Developer plugin will display in the Warnings view a list with all the registered extension functions, extension elements and extension modules.
- Refuses to write to any file or resource If checked, the XSLTProc processor will not write any part of the
 transformation result to an external file on disk. If such an operation is requested by the processed XSLT stylesheet
 the transformation ends with a runtime error.
- **Refuses to create directories** If checked, the XSLTProc processor will not create any directory during the transformation process. If such an operation is requested by the processed XSLT stylesheet the transformation ends with a runtime error.

MSXML Preferences

To configure the MSXML options, *open the Preferences dialog box* and go to **XML** > **XSLT/FO/XQuery** > **XSLT** > **MSXML**.

The options of the MSXML 3.0 and 4.0 processors are the same as *the ones available in the command line for the MSXML processors*:

- Validate documents during parse phase If checked and either the source or stylesheet document has a DTD or schema against which its content can be checked, validation is performed.
- Do not resolve external definitions during parse phase By default, MSXSL instructs the parser to resolve external
 definitions such as document type definition (DTD), external subsets or external entity references when parsing the
 source and style sheet documents. If this option is checked the resolution is disabled.
- Strip non-significant whitespaces If checked, strips non-significant white space from the input XML document during the load phase. Enabling this option can lower memory usage and improve transformation performance while, in most cases, creating equivalent output.
- Show time information If checked, the relative speed of various transformation steps can be measured:

- The time to load, parse, and build the input document.
- The time to load, parse, and build the stylesheet document.
- The time to compile the stylesheet in preparation for the transformation.
- The time to execute the stylesheet.
- Start transformation in this mode Although stylesheet execution usually begins in the empty mode, this default
 may be changed by specifying another mode. Changing the start mode allows execution to jump directly to an
 alternate group of templates.

MSXML.NET Preferences

To configure the MSXML.NET options, *open the Preferences dialog box* and go to XML > XSLT/FO/XQuery > XSLT > MSXML.NET.

The options of the MSXML.NET processor are:

- **Enable XInclude processing** If checked, XInclude references will be resolved when MSXML.NET is used as transformer in the *XSLT transformation scenario*.
- Validate documents during parse phase If checked and either the source or stylesheet document has a DTD or schema against which its content can be checked, validation is performed.
- **Do not resolve external definitions during parse phase** By default MSXML.NET resolves external definitions such as DTD external subsets or external entity references when parsing source XML document and stylesheet document. Using this option you can disable this behavior. Note, that it may affect also the validation process for the XML document.
- Strip non-significant whitespaces If checked, strips non-significant white space from the input XML document
 during the load phase. Enabling this option can lower memory usage and improve transformation performance while,
 in most cases, creating equivalent output.
- **Show time information** If checked, the relative speed of various transformation steps can be measured:
 - The time to load, parse, and build the input document.
 - The time to load, parse, and build the stylesheet document.
 - The time to compile the stylesheet in preparation for the transformation.
 - The time to execute the stylesheet.
- Forces ASCII output encoding There is a known problem with .NET 1.X XSLT processor (System.Xml.Xsl.XslTransformclass): it doesn't support escaping of characters as XML character references when they cannot be represented in the output encoding. That means that when you output a character that cannot be represented in output encoding, it will be outputted as '?'. Usually this happens when output encoding is set to ASCII. With this option checked the output is forced to be ASCII encoded and all non-ASCII characters get escaped as XML character references (&#nnnn; form).
- Allow multiple output documents This option allows to create multiple result documents using the exsl:document extension element.
- Use named URI resolver class This option allows to specify a custom URI resolver class to resolve URI references in xsl:import and xsl:include instructions (during XSLT stylesheet loading phase) and in document() function (during XSL transformation phase).
- Assembly file name for URI resolver class The previous option specifies partially or fully qualified URI resolver class name (for example, Acme.Resolvers.CacheResolver). Such name requires additional assembly specification using this option or the next option, but fully qualified class name (which always includes an assembly specifier) is all-sufficient. See MSDN for more info about *fully qualified class names*. This option specifies a file name of the assembly, where the specified resolver class can be found.
- Assembly GAC name for URI resolver class This option specifies partially or fully qualified name of the assembly in the *global assembly cache* (GAC), where the specified resolver class can be found. See MSDN for more info about *partial assembly names*. Also see the previous option.
- List of extension object class names This option allows to specify extension object classes, whose public methods then can be used as extension functions in an XSLT stylesheet. It is a comma-separated list of namespace-qualified extension object class names. Each class name must be bound to a namespace URI using prefixes, similar to providing XSLT parameters.

- Use specified EXSLT assembly MSXML.NET supports a rich library of the EXSLT and EXSLT.NET extension
 functions embedded or in a plugged in EXSLT.NET library. EXSLT support is enabled by default and cannot be
 disabled in this version. If you want to use an external EXSLT.NET implementation instead of a built-in one use
 this option.
- Credential loading source xml This option allows to specify user credentials to be used when loading XML source documents. The credentials should be provided in the username:password@domain format (all parts are optional).
- Credential loading stylesheet This option allows to specify user credentials to be used when loading XSLT stylesheet documents. The credentials should be provided in the username:password@domain format (all parts are optional).

XQuery Preferences

To configure the **XQuery** options, *open the Preferences dialog box* and go to **XML** > **XSLT/FO/XQuery** > **XQuery**. The generic XQuery preferences are the following:

- XQuery validate with Allows you to select the processor that validates XQuery documents. If you are validating an XQuery file that has an associated validation scenario, Oxygen XML Developer plugin uses the processor specified in the scenario. If no validation scenario is associated, but the file has an associated transformation scenario, the processor specified in the scenario is used. If the processor does not support validation or if no scenario is associated, then the value from this combo box will be used as validation processor.
- Size limit of Sequence view (MB) When the result of an XQuery transformation is set in the transformation scenario as sequence the size of one chunk of the result that is fetched from the database in lazy mode in one step is set in this option. If this limit is exceed, go to the Sequence view and click More results available to extract more data from the database.
- **Format transformer output** Specifies whether the output of the transformer is formatted and indented (pretty printed).
 - Ξ,

Note: This option is ignored if you choose **Sequence** (lazy extract data from a database) from the associated transformation scenario.

- Create structure indicating the type nodes If checked, Oxygen XML Developer plugin takes the results of a query and creates an XML document containing copies of all items in the sequence, suitably wrapped.
 - Ξ,

Note: This option is ignored if you choose **Sequence** (lazy extract data from a database) from the associated transformation scenario.

Saxon HE/PE/EE Preferences

To configure the **Saxon HE/PE/EE** options, *open the Preferences dialog box* and go to **XML** > **XSLT/FO/XQuery** > **XQuery** > **Saxon HE/PE/EE**.

The XQuery preferences for the Saxon 9.6.0.7 Home Edition (HE), Professional Edition (PE), and Enterprise Edition (EE) are as follows:

- Use a configuration file ("-config") Sets a Saxon 9 configuration file that is used for XQuery transformation and validation
- Recoverable errors ("-warnings")- Allows you to choose how dynamic errors are handled. The following options
 can be selected:
 - recover silently ("silent") Continues processing without reporting the error.
 - recover with warnings ("recover") Issues a warning but continues processing.
 - signal the error and do not attempt recovery ("fatal") Issues an error and stops processing.
- Strip whitespaces ("-strip") Can have one of the following values:
 - All ("all") Strips *all* whitespace text nodes from source documents before any further processing, regardless of any xml: space attributes in the source document.

- **Ignore** ("**ignorable**") Strips all *ignorable* whitespace text nodes from source documents before any further processing, regardless of any xml: space attributes in the source document. Whitespace text nodes are ignorable if they appear in elements defined in the DTD or schema as having element-only content.
- None ("none") Strips *no* whitespace before further processing.
- Optimization level ("-opt") Set the optimization level. The value is an integer in the range 0 (no optimization) to 10 (full optimization). This option allows optimization to be suppressed when reducing the compiling time is important, optimization conflicts with debugging, or optimization causes extension functions with side-effects to behave unpredictably.
- Use linked tree model ("-tree:linked") This option activates the linked tree model.
- Enable XQuery 3.0 support ("-qversion:(1.0|3.0)") If checked, Saxon runs the XQuery transformation with the XQuery 3.0 support (this option is enabled by default).

The following option is available for Saxon 9.6.0.7 Professional Edition (PE) and Enterprise Edition (EE) only:

• Allow calls on extension functions ("-ext") - If checked, calls on external functions are allowed. Checking this option is recommended in an environment where untrusted stylesheets may be executed. It also disables user-defined extension elements and the writing of multiple output files, both of which carry similar security risks.

The options available specifically for Saxon 9.6.0.7 Enterprise Edition (EE) are as follows:

- Validation of the source file ("-val") Requests schema-based validation of the source file and of any files read using the document () or similar functions. It can have the following values:
 - Schema validation ("strict") This mode requires an XML Schema and enables parsing the source documents with strict schema-validation enabled.
 - Lax schema validation ("lax") If an XML Schema is provided, this mode enables parsing the source documents with schema-validation enabled but the validation will not fail if, for example, element declarations are not found.
 - Disable schema validation This specifies that the source documents should be parsed with schema-validation disabled.
- Validation errors in the results tree treated as warnings ("-outval") Normally, if validation of result documents is requested, a validation error is fatal. Enabling this option causes such validation failures to be treated as warnings.
- Enable XQuery update ("-update:(on|off)") This option controls whether or not XQuery update syntax is accepted. The default value is off.
- Backup files updated by XQuery ("-backup:(on|off)") If checked, backup versions for any XML files updated with XQuery Update are generated. This option is available when the Enable XQuery update option is enabled.

Saxon HE/PE/EE Advanced Preferences

To configure **Saxon HE/PE/EE Advanced** preferences, *open the Preferences dialog box* and go to **XML** > **XSLT/FO/XQuery** > **XQuery** > **Saxon HE/PE/EE** > **Advanced**.

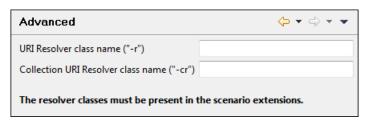

Figure 266: The Saxon HE/PE/EE XQuery Advanced Preferences Panel

The advanced XQuery options which can be configured for the Saxon 9.6.0.7 XQuery transformer (all editions: Home Edition, Professional Edition, Enterprise Edition) are the following:

• **URI Resolver class name** - Allows you to specify a custom implementation for the URI resolver used by the XQuery Saxon 9.6.0.7 transformer (the -r option when run from the command line). The class name must be fully specified and the corresponding jar or class extension must be configured from *the dialog box for configuring the XQuery extension* for the particular transformation scenario.

Note: If your URIResolver implementation does not recognize the given resource, the resolve(String href, String base) method should return a null value. Otherwise, the given resource will not be resolved through the *XML catalog*.

• Collection URI Resolver class name - Allows you to specify a custom implementation for the Collection URI resolver used by the XQuery Saxon 9.6.0.7 transformer (the -cr option when run from the command line). The class name must be fully specified and the corresponding jar or class extension must be configured from the dialog box for configuring the XQuery extension for the particular transformation scenario.

Debugger Preferences

To configure the **Debugger** preferences, *open the Preferences dialog box* and go to **XML** > **XSLT/FO/XQuery** > **Debugger**.

The following preferences are available:

- **Show xsl:result-document output** if checked, the debugger presents the output of xsl:result-document instructions into the debugger output view.
- Infinite loop detection set this option to receive notifications when an infinite loop occurs during transformation.
- **Maximum depth in templates stack** sets how many xsl:template instructions can appear on the current stack. This setting is used by the infinite loop detection.
- **Debugger layout** a horizontal layout means that the stack of XML editors takes the left half of the editing area and the stack of XSL editors takes the right one. A vertical layout means that the stack of XML editors takes the upper half of the editing area and the stack of XSL editors takes the lower one.
- **XWatch evaluation timeout (seconds)** specifies the maximum time that Oxygen XML Developer plugin allocates to the evaluation of XPath expressions while debugging.
- Messages specifies whether a debugging session is stopped, is continued, or you are asked what to do when you are editing the source document involved in a debugging session.

Annotations Preferences

To configure the **Annotations** options, go to **Window** (**Eclipse** on Mac OSX) and choose **Preferences**. Then go to **General** > **Editors** > **Text Editors** > **Annotations**.

The following Oxygen XML Developer plugin preferences are available:

• XSLT/XQuery Debug Current Instruction Pointer - Controls the background color of the current execution node, both in the document (XML) and XSL/XQuery views.

Profiler Preferences

This section explains the settings available for the XSLT Profiler. To access and modify these settings, *open the Preferences dialog box* and go to XML > XSLT/FO/XQuery > Profiler (see *Debugger Preferences* on page 586).

The following profile settings are available:

- **Show time** Shows the total time that was spent in the call.
- **Show inherent time** Shows the inherent time that was spent in the call. The inherent time is defined as the total time of a call minus the time of its child calls.
- Show invocation count Shows how many times the call was called in this particular call sequence.
- Time scale The time scale options determine the unit of time measurement, which may be milliseconds or microseconds.
- *Hotspot* threshold The threshold below which hot spots are ignored (milliseconds).
- Ignore invocation less than The threshold below which invocations are ignored (microseconds).
- Percentage calculation The percentage base that determines what time span percentages are calculated against:
 - **Absolute** Percentage values show the contribution to the total time.
 - **Relative** Percentage values show the contribution to the calling call.

Oxygen XML Developer plugin includes a built-in formatting objects processor (Apache FOP), but you can also configure other external processors and use them in the transformation scenarios for processing XSL-FO documents.

Oxygen XML Developer plugin provides an easy way to add two of the most commonly used commercial FO processors: *RenderX XEP* and *Antenna House Formatter*. You can easily add *RenderX XEP* as an external FO processor if you have the XEP installed. Also, if you have the *Antenna House Formatter*, Oxygen XML Developer plugin uses the environment variables set by the XSL formatter installation to detect and use it for XSL-FO transformations. If the environment variables are not set for the XSL formatter installation, you can browse and choose the executable file just as you would for XEP. You can use these two external FO processors for *DITA OT transformations scenarios* and *XML with XSLT transformation scenarios*.

To configure the options for the FO Processors, *open the Preferences dialog box* and go to **XML** > **XSLT/FO/XQuery** > **FO Processors**. The **FO Processors** preferences page is displayed.

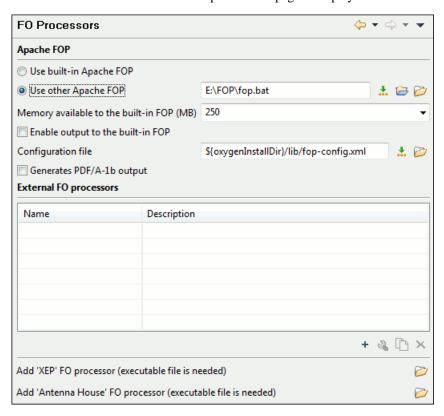

Figure 267: The FO Processors Preferences Page

Apache FOP Section

In this section you can configure options for the built-in Apache processor. The following options are available:

Use built-in Apache FOP

Instructs Oxygen XML Developer plugin to use the built-in Apache FO processor.

Use other Apache FOP

Instructs Oxygen XML Developer plugin to use another Apache FO processor that is installed on your computer.

Enable the output of the built-in FOP

All Apache FOP output is displayed in a results pane at the bottom of the Oxygen XML Developer plugin window, including warning messages about FO instructions not supported by Apache FOP.

Memory available to the built-in FOP

If your Apache FOP transformations fail with an Out of Memory error (**OutOfMemoryError**), use this combo box to select a bigger value for the amount of memory reserved for FOP transformations.

Configuration file for the built-in FOP

Use this option to specify the path to an Apache FOP configuration file (for example, to render to PDF a document containing Unicode content using a special *true type* font).

Generates PDF/A-1b output

When selected, PDF/A-1b output is generated.

Note: All fonts have to be embedded, even the implicit ones. More information about configuring metrics files for the embedded fonts can be found in *Add a font to the built-in FOP*.

Note: You cannot use the <filterList> key in the configuration file since the FOP would generate the following error: *The Filter key is prohibited when PDF/A-1 is active.*

External FO Processors Section

In this section you can manage the external FO processors you want to use in transformation scenarios. You can use the two options at the bottom of the section to use the *RenderX XEP* or *Antenna House Formatter* commercial FO processors.

Add 'XEP' FO processor (executable file is needed)

If *RenderX XEP* is already installed on your computer, you can use this button to choose the XEP executable script (xep.bat for Windows, xep for Linux).

Add 'Antenna House' FO processor (executable file is needed)

If *Antenna House Formatter* is already installed on your computer, you can use this button to choose the Antenna House executable script (AHFCmd.exe or XSLCmd.exe for Windows, and run.sh for Linux/Mac OS).

Note: The built-in Antenna House Formatter GUI transformation scenario requires that you configure an external FO processor that runs AHFormatter.exe (Windows only). In the *external FO Processor configuration dialog box*, you could use "\${env(AHF62_64_HOME)}\AHFormatter.exe" -d \${fo} -s for the value in the Command line field, although the environment variable name changes for each version of the AH Formatter and for each system architecture (you can install multiple versions side-by-side). For more information, see https://github.com/AntennaHouse/focheck/wiki/focheck.

You can also add external processors or configure existing ones. Press the **New** button to open a configuration dialog box that allows you to add a new external FO processor. Use the other buttons (**Edit**, **Duplicate**, **Delete**) to configure existing external processors.

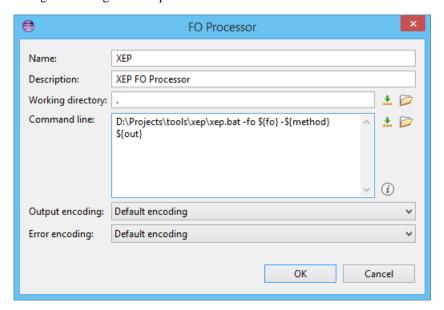

Figure 268: The External FO Processor Configuration Dialog Box

The external **FO Processor** configuration dialog box includes the following options:

Name

The name that will be displayed in the list of available FO processors on the FOP tab of the transformation scenario dialog box.

Description

A textual description of the FO processor that will be displayed in the FO processors table and in tooltips of UI components where the processor is selected.

Working directory

The directory where the intermediate and final results of the processing is stored. You can use one of the following editor variables:

- **\${homeDir}** The path to the user home directory.
- \${cfd} The path of the current file directory. If the current file is not a local file, the target is the user desktop directory.
- \${pd} The project directory.
- \${oxygenInstallDir} -The Oxygen XML Developer plugin installation directory.

Command line

The command line that starts the FO processor, specific to each processor. You can use one of the following editor variables:

- **\${method}** The FOP transformation method: **pdf**, **ps**, or **txt**.
- \${fo} The input FO file.
- **\${out}** The output file.
- **\${pd}** The project directory.
- **\${frameworksDir}** The path of the frameworks subdirectory of the Oxygen XML Developer plugin installation directory.
- \${oxygenInstallDir} The Oxygen XML Developer plugin installation directory.
- \${ps} The platform-specific path separator. It is used between the library files specified in the class path of the command line.

Output Encoding

The encoding of the FO processor output stream that is displayed in a results panel at the bottom of the Oxygen XML Developer plugin window.

Error Encoding

The encoding of the FO processor error stream that is displayed in a results panel at the bottom of the Oxygen XML Developer plugin window.

XPath Preferences

To configure the XPath options, open the Preferences dialog box and go to XML > XSLT/FO/XQuery > XPath.

Oxygen XML Developer plugin allows you to customize the following options:

• Unescape XPath expression - the entities of an XPath expressions that you type in the XPath/XQuery Builder are unescaped during their execution. For example the expression

```
//varlistentry[starts-with(@os,'s')]
```

is equivalent with:

```
//varlistentry[starts-with(@os,'s')]
```

- **No namespace** if you enable this option, Oxygen XML Developer plugin considers unprefixed element names of the evaluated XPath 2.0 / 3.0 expressions as belonging to no namespace.
- Use the default namespace from the root element if you enable this option, Oxygen XML Developer plugin considers unprefixed element names of the evaluated XPath expressions as belonging to the default namespace declared on the root element of the XML document you are querying.

- Use the namespace of the root if you enable this option, Oxygen XML Developer plugin considers unprefixed
 element names of the evaluated XPath expressions as belonging to the same namespace as the root element of the
 XML document you are querying.
- This namespace in this field you can enter the namespace of the unprefixed elements.
- **Default prefix-namespace mappings** in this field you can associate prefixes with namespaces. Use these mappings when you want to define them globally, not for each document.

Custom Engines Preferences

You can configure and run XSLT and XQuery transformations with processors other than the ones which come with the Oxygen XML Developer plugin distribution.

Note:

To configure the **Custom Engines** preferences, *open the Preferences dialog box* and go to **XML** > **XSLT/FO/XQuery** > **Custom Engines**.

The following parameters can be configured for a custom engine:

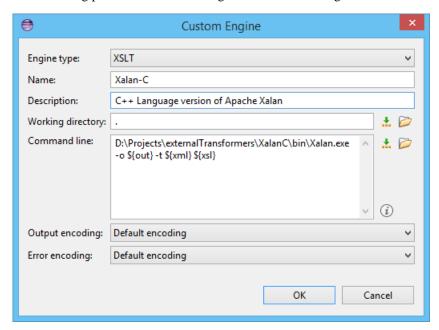

Figure 269: Parameters of a Custom Engine

- **Engine type** Combo box allowing you to choose the transformer type. There are two options: XSLT engines and XQuery engines.
- Name The name of the transformer displayed in the dialog box for editing transformation scenarios
- **Description** A textual description of the transformer.
- Working directory The start directory of the transformer executable program. The following editor variables are available for making the path to the working directory independent of the location of the input files:
 - **\${homeDir}** The user home directory in the operating system.
 - \${cfd} The path to the directory of the current file.
 - **\${pd}** The path to the directory of the current project.
 - \${oxygenInstallDir} The Oxygen XML Developer plugin install directory.
- Command line The command line that must be executed by Oxygen XML Developer plugin to perform a transformation with the engine. The following editor variables are available for making the parameters in the command line (the transformer executable, the input files) independent of the location of the input files:
 - \${xml} The XML input document as a file path.
 - \${xmlu} The XML input document as a URL.

- \${xsl} The XSL / XQuery input document as a file path.
- \${xslu} The XSL / XQuery input document as a URL.
- **\${out}** The output document as a file path.
- \${outu} The output document as a URL.
- \${ps} The platform separator which is used between library file names specified in the class path.
- Output Encoding The encoding of the transformer output stream.
- Error Encoding The encoding of the transformer error stream.

Import Preferences

To configure the **Import** options, *open the Preferences dialog box* and go to **XML** > **Import**. This page allows you to configure how empty values and null values are handled when they are encountered in imported database tables or Excel sheets. Also you can configure the format of date / time values recognized in the imported database tables or Excel sheets.

The following options are available:

- Create empty elements for empty values If checked, an empty value from a database column or from a text file is imported as an empty element.
- Create empty elements for null values If checked, null values from a database column are imported as empty
 elements
- **Escape XML content** Enabled by default, this option instructs Oxygen XML Developer plugin to escape the imported content to an XML-safe form.
- Add annotations for generated XML Schema If checked, the generated XML Schema contains an annotation
 for each of the imported table columns. The documentation inside the annotation tag contains the remarks of the
 database columns (if available) and also information about the conversion between the column type and the generated
 XML Schema type.

The section **Date / Time Format** specifies the format used for importing date and time values from Excel spreadsheets or database tables and in the generated XML schemas. The following format types are available:

- Unformatted If checked, the date and time formats specific to the database are used for import. When importing data from Excel a string representation of date or time values are used. The type used in the generated XML Schema is xs:string.
- XML Schema date format If checked, the XML Schema-specific format ISO8601 is used for imported date / time data (yyyy-MM-dd'T'HH:mm:ss for datetime, yyyy-MM-dd for date and HH:mm:ss for time). The types used in the generated XML Schema are xs:datetime, xs:date and xs:time.
- **Custom format** If checked, you can define a custom format for timestamp, date, and time values or choose one of the predefined formats. A preview of the values is presented when a format is used. The type used in the generated XML Schema is xs:string.

Date / Time Patterns Preferences

Table 11: Pattern letters

Letter	Date or Time Component	Presentation	Examples
G	Era designator	Text	AD
у	Year	Year	1996; 96
M	Month in year	Month	July; Jul; 07
w	Week in year	Number	27
W	Week in month	Number	2
D	Day in year	Number	189
d	Day in month	Number	10

Letter	Date or Time Component	Presentation	Examples
F	Day of week in month	Number	2
E	Day in week	Text	Tuesday; Tue
a	Am / pm marker	Text	PM
Н	Hour in day (0-23)	Number	0
k	Hour in day (1-24)	Number	24
K	Hour in am / pm (0-11)	Number	0
h	Hour in am / pm (1-12)	Number	12
m	Minute in hour	Number	30
s	Second in minute	Number	55
S	Millisecond	Number	978
Z	Time zone	General time zone	Pacific Standard Time; PST; GMT-08:00
Z	Time zone	RFC 822 time zone	-0800

Pattern letters are usually repeated, as their number determines the exact presentation:

- *Text* If the number of pattern letters is 4 or more, the full form is used; otherwise a short or abbreviated form is used if available.
- *Number* The number of pattern letters is the minimum number of digits, and shorter numbers are zero-padded to this amount.
- Year If the number of pattern letters is 2, the year is truncated to 2 digits; otherwise it is interpreted as a number.
- *Month* If the number of pattern letters is 3 or more, the month is interpreted as text; otherwise, it is interpreted as a number.
- *General time zone* Time zones are interpreted as text if they have names. For time zones representing a GMT offset value, the following syntax is used:
 - GMTOffsetTimeZone GMT Sign Hours : Minutes
 - Sign one of + or -
 - Hours one or two digits
 - Minutes two digits
 - *Digit* one of 0 1 2 3 4 5 6 7 8 9

Hours must be between 0 and 23, and Minutes must be between 00 and 59. The format is locale independent and digits must be taken from the Basic Latin block of the Unicode standard.

- RFC 822 time zone: The RFC 822 4-digit time zone format is used:
 - RFC822TimeZone Sign TwoDigitHours Minutes
 - TwoDigitHours a number of two digits

TwoDigitHours must be between 00 and 23.

XML Signing Certificates Preferences

Oxygen XML Developer plugin provides two types of *keystores* for certificates that are used for digital signatures of XML documents: Java KeyStore (**JKS**) and Public-Key Cryptography Standards version 12 (**PKCS-12**). A *keystore* file is protected by a password. To configure a certificate *keystore*, *open the Preferences dialog box* and go to **XML** > **XML Signing Certificates**. You can customize the following parameters of a *keystore*:

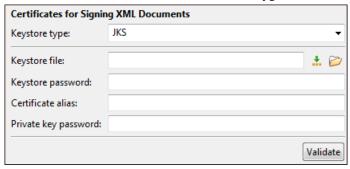

Figure 270: The Certificates Preferences Panel

- **Keystore type** The type of *keystore* that Oxygen XML Developer plugin uses (**JKS** or **PKCS-12**).
- **Keystore file** The location of the imported file.
- **Keystore password** The password that is used for protecting the privacy of the stored keys.
- Certificate alias The alias used for storing the key entry (the certificate or the private key) inside the keystore.
- **Private key password** The private key password of the certificate (required only for JKS keystores).
- Validate Press this button to verify the configured keystore and the validity of the certificate.

XML Structure Outline Preferences

To configure the XML Structure Outline options, open the Preferences dialog box and go to XML Structure Outline, which contains the following preferences:

- **Preferred attribute names for display** The preferred attribute names when displaying the attributes of an element in the Outline view. If there is no preferred attribute name specified, the first attribute of an element is displayed.
- **Enable outline drag and drop** Drag and drop is disabled for the tree displayed in the **Outline** view only if there is a possibility to accidentally change the structure of the document by such operations.

Configuring Options

A set of options controls the behavior of Oxygen XML Developer plugin, allowing you to configure most of the features. To offer you the highest degree of flexibility in customizing the application to fit the needs of your organization, Oxygen XML Developer plugin comes with several distinct layers of option values.

The option layers are as follows (sorted from high priority to low):

Global Options

Allows individual users to personalize Oxygen XML Developer plugin according to their specific needs.

Customized Default Options

Designed to customize the initial option values for a group of users, this layer allows an administrator to deploy the application preconfigured with a standardized set of option values.

Note: Once this layer is set, it represents the initial state of Oxygen XML Developer plugin when an end-user uses the **Restore defaults** or **Reset Global Options** actions.

Default Options

The predefined default or built-in values, tuned so that Oxygen XML Developer plugin behaves optimally in most working environments.

Note: If you set a specific option in one of the layers, but it is not applied in the application, make sure that one of the higher priority layers does not overwrite it.

Oxygen XML Developer plugin has an extensive set of options that you can configure. When Oxygen XML Developer plugin in installed, these options are set to default values. You can provide a different set of default values for an installation using an XML *options file*.

Creating an XML Options File

To create an *options file*, follow these steps:

- 1. It is recommended that you use a fresh install for this procedure, to make sure that you do not copy personal or local preferences.
- 2. Open Oxygen XML Developer plugin and open the Preferences dialog box.
- **3.** Go through the options and set them to the desired defaults.
- 4. Go to back to the main preferences page and click Export Global Options to create an XML options file.

Using Customized Default Options

Use either one of the following ways to configure an Oxygen XML Developer plugin installation to use customized default options from a created XML options file:

- In the [OXYGEN_DIR] installation folder, create a folder called preferences and copy the XML options file into it (for example,
 - [Eclipse-platform-install-folder]/plugins/com.oxygenxml.editor/preferences/default.xml or [Eclipse-platform-install-folder]/dropins/[OXYGEN_DIR]/preferences/default.xml if the plugin was installed as a drop-in).
- Set the path to the XML options file as the value of the com.oxygenxml.default.options system property in the Eclipse configuration file.

Add the following line in the [Eclipse-platform-install-folder]/configuration/config.ini file:

com.oxygenxml.default.options=file\:@config.dir/../default.xml

Importing / Exporting Global Options

Actions for importing, exporting, and resetting global options are available in the preferences page of the Oxygen XML Developer plugin. To open this page, *open the Preferences dialog box*. The export operation allow you to save global preferences as an XML options file and the import operation allows you to load the options file. You can use this file to reload the options on your computer or to share with others.

The following buttons are available at the bottom of the preferences page:

Reset Global Options

Restores the preference to the factory defaults or to *customized defaults*.

Import Global Options

Allows you to import a set of *Global Options* from an exported XML options file. You can also select a project file (.xpr) to import all the *Global Options* that are set in that project file. After you select a file, the **Import Global Options** dialog box is displayed and it informs you that the operation will only override the options that are included in the imported file. You can enable the **Reset all other options to their default values** option to reset all options to the default values before the file is imported.

Export Global Options

Allows you to export *Global Options* to an XML options file. Some user-specific options that are private are not included. For example, passwords and the name of the *Review Author* is not included in the export operation.

Reset Global Options

To reset all global preferences to their default values, open the Preferences dialog box and click the Reset Global Options button.

This action also resets the transformation and validation scenarios to the default scenarios.

Scenarios Management

You can export global transformation and validation scenarios into specialized scenarios files. You can import transformation and validation scenarios from various sources (such as project files, framework option files, or exported scenario files). To access these import and export actions, open the **Preferences** dialog box and go to **Scenarios Management**. The following actions are available:

Import Global Transformation Scenarios 🗀 🛮 Button

Loads a set of transformation scenarios from a project file, framework options file, or exported scenarios file.

Export Global Transformation Scenarios 💾 Button

Stores a set of global (not project-level) transformation scenarios in a specialized scenarios file.

Import Global Validation Scenarios 🗎 Button

Loads a set of validation scenarios from a project file, framework options file, or exported scenarios file.

Export Global Validation Scenarios 🗎 Button

Stores a set of global (not project-level) Validation scenarios in a specialized scenarios file.

The Export Global Transformation Scenarios and Export Global Validation Scenarios options are used to store all the scenarios in a separate file. Associations between document URLs and scenarios are also saved in this file. You can load the saved scenarios using the Import Global Transformation Scenarios and Import Global Validation Scenarios actions. To distinguish the existing scenarios and the imported ones, the names of the imported scenarios contain the word import.

Editor Variables

An editor variable is a shorthand notation for context-dependent information, such as a file or folder path, a time-stamp, or a date. It is used in the definition of a command (for example, the input URL of a transformation, the output file path of a transformation, or the command line of an external tool) to make a command or a parameter generic and re-usable with other input files. When the same command is applied to different files, the notation is expanded at the execution of the command so that the same command has different effects depending on the actual file.

You can use the following editor variables in Oxygen XML Developer plugin commands of external engines or other external tools, in transformation scenarios, and in validation scenarios:

- \$\{oxygenHome\}\ Oxygen XML Developer plugin installation folder as URL.
- *\$\left\{oxygenInstallDir\right\}* Oxygen XML Developer plugin installation folder as file path.
- \$\{\text{framework}\}\ The path (as URL) of the current framework, as part of the [OXYGEN_DIR]/frameworks
- *\${framework(fr_name)}* The path (as URL) of the fr_name framework.
- *\$\{frameworkDir(fr name)\}* The path (as file path) of the fr name framework.

Note: Since multiple frameworks might have the same name (although it is not recommended), for both \$\{framework(fr_name)\}\ and \$\{frameworkDir(fr_name)\}\ editor variables Oxygen XML Developer plugin employs the following algorithm when searching for a given framework name:

All frameworks are sorted, from high to low, according to their *Priority* setting from the *Document Type* configuration dialog box. Only frameworks that have the **Enabled** checkbox set are taken into account.

- Next, if the two or more frameworks have the same name and priority, a further sorting based on the **Storage** setting is made, in the exact following order:
 - Frameworks stored in the internal Oxygen XML Developer plugin options.
 - Additional frameworks added in the *Locations preferences page*.
 - Frameworks installed using the add-ons support.
 - Frameworks found in the *main frameworks location* (**Default** or **Custom**).
- *\${frameworks}* The path (as URL) of the <code>[OXYGEN_DIR]</code> directory.
- \$\(\frameworkDir\)\) The path (as file path) of the current framework, as part of the [OXYGEN_DIR]/frameworks directory.
- \$\{frameworksDir\}\- The path (as file path) of the [OXYGEN DIR]/frameworksdirectory.
- \${home} The path (as URL) of the user home folder.
- *\${homeDir}* The path (as file path) of the user home folder.
- \$\(\frac{1}{2}\) pdu\) Current project folder as URL. Usually the current folder selected in the **Project** View.
- \$\{pd\}\ Current project folder as file path. Usually the current folder selected in the **Project** View.
- *\${pn}* Current project name.
- \$\{cfdu\}\ Current file folder as URL, that is the path of the current edited document up to the name of the parent folder, represented as a URL.
- \$\(\frac{1}{2}\) Current file folder as file path, that is the path of the current edited document up to the name of the parent folder.
- \$\{cfn\}\ Current file name without extension and without parent folder. The current file is the one currently opened and selected.
- \$\(\frac{fne}{c}\) Current file name with extension. The current file is the one currently opened and selected.
- \$\(\frac{1}{2}\) Current file as file path, that is the absolute file path of the current edited document.
- \${af} The local file path of the ZIP archive that includes the current edited document.
- \$\{afu\}\ The URL path of the ZIP archive that includes the current edited document.
- \$\(afd \)\ The local directory path of the ZIP archive that includes the current edited document.
- \$\(afdu \)\) The URL path of the directory of the ZIP archive that includes the current edited document.
- \${afn} The file name (without parent directory and without file extension) of the zip archive that includes the current edited file.
- \${afne} The file name (with file extension, for example .zip or .epub, but without parent directory) of the zip archive that includes the current edited file.
- \${currentFileURL} Current file as URL, that is the absolute file path of the current edited document represented as URL.
- \${ps} Path separator, that is the separator which can be used on the current platform (Windows, OS X, Linux) between library files specified in the class path.
- *\${timeStamp}* Time stamp, that is the current time in Unix format. It can be used for example to save transformation results in different output files on each transform.
- *\${caret}* The position where the cursor is located. This variable can be used in a code template, in **Author** mode operations, or in a selection plugin.
- *\${selection}* The current selected text content in the current edited document. This variable can be used in a code template, in **Author** mode operations, or in a selection plugin.
- \$\(\frac{1}{id}\)\) Application-level unique identifier; a short sequence of 10-12 letters and digits which is not guaranteed to be universally unique.
- \${uuid} Universally unique identifier, a unique sequence of 32 hexadecimal digits generated by the Java <u>UUID</u>
 class
- \$\{env(VAR_NAME)\}\} Value of the \(VAR_NAME\) environment variable. The environment variables are managed by the operating system. If you are looking for Java System Properties, use the \$\{system(var.name)\}\) editor variable.
- \$\{\system(var.name)\}\} Value of the var.name Java System Property. The Java system properties can be specified in the command line arguments of the Java runtime as -Dvar.name=var.value. If you are looking for operating system environment variables, use the \$\{\end{env}(VAR_NAME)\}\}\$ editor variable instead.

- \${ask('message', type, ('real_value1': 'rendered_value1'; 'real_value2': 'rendered_value2'; ...), 'default_value')} To prompt for values at runtime, use the ask('message', type, ('real_value1': 'rendered_value1'; 'real_value2': 'rendered_value2'; ...), 'default-value'') editor variable. You can set the following parameters:
 - 'message' The displayed message. Note the quotes that enclose the message.
 - type Optional parameter, with one of the following values:

Parameter	
url	Format: \${ask('message', url, 'default_value')}
	Description: Input is considered a URL. Oxygen XML Developer plugin checks that the provided URL is valid.
	Example:
	 \${ask('Input URL', url)} - The displayed dialog box has the name Input URL. The expected input type is URL. \${ask('Input URL', url, 'http://www.example.com')} - The displayed dialog box has the name Input URL. The expected input type is URL. The input field displays the default value http://www.example.com.
password	Format: \${ask('message', password, 'default')}
	Description: The input is hidden with bullet characters.
	Example:
	 \${ask('Input password', password)} - The displayed dialog box has the name 'Input password' and the input is hidden with bullet symbols. \${ask('Input password', password, 'abcd')} - The displayed dialog box has the name 'Input password' and the input hidden with bullet symbols. The input field already contains the default abcd value.
generic	Format: \${ask('message', generic, 'default')}
	Description: The input is considered to be generic text that requires no special handling.
	Example:
	 \${ask('Hello world!')} - The dialog box has a Hello world! message displayed. \${ask('Hello world!', generic, 'Hello again!')} - The dialog box has a Hello world! message displayed and the value displayed in the input box is 'Hello again!'.
relative_url	<pre>Format: \${ask('message', relative_url, 'default')}</pre>
	Description: Input is considered a URL. Oxygen XML Developer plugin tries to make the URL relative to that of the document you are editing.
	Note: If the \$ask editor variable is expanded in content that is not yet saved (such as an <i>untitled</i> file, whose path cannot be determined), then Oxygen XML Developer plugin will transform it into an absolute URL.
	Example:
	• \${ask('File location', relative_url, 'C:/example.txt')} - The dialog box has the name 'File location'. The URL inserted in the input box is made relative to the current edited document location.

	=00	

Parameter	
	Note: The 'default' parameter specifies the default selected value and can match either a key or a value.
	Example:
	• \${ask('Operating System', radio, ('win':'Microsoft Windows';'osx':'Mac OS X';'lnx':'Linux/UNIX'), 'osx')}- The dialog box has the name 'Operating System'. The radio button group allows you to choose between the three operating systems.
	Note: In this example Mac OS X is the default selected value and if selected it would return osx for the output.

- 'default-value' optional parameter. Provides a default value.
- \$\{date(pattern)\}\} Current date. The allowed patterns are equivalent to the ones in the \(\overline{Java SimpleDateFormat class.} \)

 Example: \(yyyy-MM-dd; \)
 - =

Note: This editor variable supports both the xs:date and xs:datetime parameters. For details about xs:date, go to http://www.w3.org/TR/xmlschema-2/#date. For details about xs:datetime, go to http://www.w3.org/TR/xmlschema-2/#dateTime.

- \$\(\frac{1}{4}\) dbgXML\\ The local file path to the XML document which is current selected in the Debugger source combo box (for tools started from the XSLT/XQuery Debugger).
- \${dbgXSL} The local file path to the XSL/XQuery document which is current selected in the Debugger stylesheet combo box (for tools started from the XSLT/XQuery Debugger).
- \$\(\frac{1}{5}\) The transformation result file path. If the current opened file has an associated scenario which specifies a transformation output file, this variable expands to it.
- \$\{dsu\}\ The path of the detected schema as an URL for the current validated XML document.
- \$\frac{1}{3}\$ The path of the detected schema as a local file path for the current validated XML document.
- \$\(\frac{1}{2}\)cop Current page number. Used to display the current page number on each printed page in the **Editor / Print** Preferences page.
- \$\(\frac{tp}{-}\) Total number of pages in the document. Used to display the total number of pages on each printed page in the **Editor / Print** Preferences page.
- \$\(\sqrt{\text{xpath eval(expression)}}\)\) Evaluates an XPath 3.0 expression. Depending on the context, the expression can be:
 - *static* When executed in a non-XML context. For example, you can use such static expressions to perform string operations on other editor variables for composing the name of the output file in a transformation scenario's **Output** tab.

Example:

```
${xpath_eval(upper-case(substring('${cfn}', 1, 4)))}
```

• *dynamic* - When executed in an XML context. For example, you can use such dynamic expression in a code template or as a value of a parameter of an **Author** mode operation.

Example:

```
${ask('Set new ID attribute', generic, '${xpath_eval(@id)}')}
```

\$\(\frac{118n(key)}\) - Editor variable used only at framework level to allow translating names and descriptions of **Author** mode actions in multiple actions.

Custom Editor Variables

An editor variable can be created and included in any user-defined expression where a built-in editor variable is also allowed. For example, a custom editor variable may be necessary for configuring the command line of an external tool, the working directory of a custom validator, the command line of a custom XSLT engine, or a custom FO processor.

You can create or configure custom editor variables in the *Custom Editor Variables preferences page*. To create a custom editor variable, click the **New** button and specify the **name** that will be used in user-defined expressions, the **value** that will replace the variable name at runtime, and a textual **description** of that variable.

Localizing of the User Interface

To localize the Oxygen XML Developer plugin, you can use one of the following methods:

- Localization through the update site:
 - Start Eclipse, go to **Help** > **Install New Software**. Press Add Site in the **Available Software** tab of the **Software** Updates dialog box. Enter http://www.oxygenxml.com/InstData/Developer/Eclipse/site.xml in the location field of the **Add Site** dialog box. Press OK. Select the language pack checkbox.
- Localization through the zip archive:
 - Go to http://www.oxygenxml.com/download.html and download the zip archive with the plugin language pack. Unzip the downloaded zip archive in the dropins subdirectory of the Eclipse install directory. Restart Eclipse.

If your operating system is running in the language you want to start Eclipse in (for example, you are using Japanese version of Windows, and you want to start Eclipse in Japanese), Oxygen XML Developer plugin matches the appropriate language from the language pack. However, if your operating system is running in a language other than the one you want to start Eclipse in (for example, you are using the English version of Windows, and you want to start Eclipse in Japanese, if you have the required operating system language support including the keyboard layouts and input method editors installed), specify the -nl <locale> command line argument when you launch Eclipse. Oxygen XML Developer plugin uses the translation file which matches the specified <locale>.

You can also localize the Eclipse plugin to a different language that the initial languages in the language pack. Duplicate the plugin.properties file from the Oxygen XML Developer plugin plugin installation directory, translate all the keys in the file and change its name to plugin_<locale>.properties.

Common Problems

Topics:

- Performance Problems
- Common Problems and Solutions

This section provides a variety of common problems and their solutions.

Performance Problems

This section contains solutions for some common performance problems that may appear when running Oxygen XML Developer plugin.

Performance Issues with Large Documents

While editing large documents in Oxygen XML Developer plugin, if you see that performance slows down considerably over time, then a possible cause is that the application needs more memory to run properly. You can increase the maximum amount of memory available to Oxygen XML Developer plugin by setting the -vmargs and -Xmx parameters in the command used to launch the Eclipse platform.

Attention: The maximum amount of memory should not be equal to the physical amount of memory available on the machine because in that case the operating system and other applications will have no memory available.

External Processes

The *Memory available to the built-in FOP* option controls the amount of memory allocated to generate PDF output with the built-in Apache FOP processor. If Oxygen XML Developer plugin throws an *Out Of Memory* error, *open the**Preferences dialog box, go to XML > XSLT-FO-XQuery > FO Processors, and increase the value of the *Memory available to the built-in FOP* option.

For external XSL-FO processors, XSLT processors, and external tools, the maximum value of the allocated memory is set in the command line of the tool using the -Xmx parameter set to the Java virtual machine.

Common Problems and Solutions

This chapter presents common problems that may appear when running the application and the solutions for these problems.

Details to Submit in a Request for Technical Support Using the Online Form

What details should I add to my request for technical support on the online form in the product website?

When completing a request for Technical Support using the online form, include as many details as possible about your problem. For problems where a simple explanation may not be enough for the Technical Support team to reproduce or address the issue (such as server connection errors, unexpected delays while editing a document, an application crash, etc.), you should generate a log file and attach it to the problem report. In the case of a crash, you should also attach the crash report file generated by your operating system.

To generate an Oxygen XML Developer plugin log file, follow these steps:

1. Create a text file called log4j.properties in the lib folder of the installed plugin folder, with the following content:

```
log4j.rootCategory= debug, R2
log4j.appender.R2=org.apache.log4j.RollingFileAppender
log4j.appender.R2.File=${user.home}/Desktop/oxygenLog/oxygen.log
log4j.appender.R2.MaxFileSize=12000KB
log4j.appender.R2.MaxBackupIndex=20
log4j.appender.R2.layout=org.apache.log4j.PatternLayout
log4j.appender.R2.layout.ConversionPattern=%r %p [ %t ] %c - %m%n
```

- **2.** Restart the application.
- 3. Reproduce the error.
- **4.** Close the application.
- 5. Delete the log4j.properties file because it might cause performance issues if you leave it in the lib folder.

1

Important: The logging mode may severely decrease the performance of the application. Therefore, please do not forget to delete the log4j.properties file when you are done with the procedure.

The resulting log file is named oxygen#.log (for example, oxygen.log, oxygen.log.1, oxygen.log.2, etc.) and is located in the Desktop\oxygenLog folder.

Oxygen XML Developer plugin Takes Several Minutes to Start on Mac

If Oxygen XML Developer plugin takes several minutes to start, the Java framework installed on the Mac may have a problem. One solution for this is to update Java to the latest version: go to **Apple symbol** > **Software Update**. After it finishes to check for updates, click **Show Details**, select the Java Update (if one is available) and click **Install**. If no Java updates are available, reset the Java preferences to their defaults. Start **Applications** > **Utilities** > **Java Preferences** and click **Restore Defaults**.

XSLT Debugger Is Very Slow

When I run a transformation in the **XSLT Debugger** perspective it is very slow. Can I increase the speed?

If the transformation produces HTML or XHTML output you should *disable rendering of output in the XHTML output view* during the transformation process. To view the XHTML output result do one of the following:

- Run the transformation in the Editor perspective and make sure the Open in Browser/System Application option is enabled.
- Run the transformation in the **XSLT Debugger** perspective, save the text output area to a file, and use a browser application for viewing it (for example Firefox or Internet Explorer).

Syntax Highlight Not Available in Eclipse Plugin

I associated the .ext extension with Oxygen XML Developer plugin in Eclipse. Why does an .ext file opened with the Oxygen XML Developer plugin plugin not have syntax highlight?

Associating an extension with Oxygen XML Developer plugin in Eclipse versions 3.6-3.8, 4.2-4.5 requires three steps:

- 1. Associate the .ext extension with the Oxygen XML Developer plugin plugin.
 - a) Open the Preferences dialog box and go to General > Editors > File Associations.
 - b) Add *.ext to the list of file types.
 - c) Select *.ext in the list by clicking it.
 - d) Add Oxygen XML Developer plugin to the list of **Associated editors** and make it the default editor.
- **2.** Associate the .ext extension with the **Oxygen XML** content type.
 - a) *Open the Preferences dialog box* and go to **General > Content Types**.
 - b) Add *.ext to the File associations list for the Text > XML > Oxygen XML Developer plugin content type.
- 3. Press the **OK** button in the Eclipse preferences dialog box.

Now when an *.ext file is opened the icon of the editor and the syntax highlight should be the same as for XML files opened with the Oxygen XML Developer plugin plugin.

Damaged File Associations on OS X

After upgrading OS X and Oxygen XML Developer plugin, it is no longer associated to the appropriate file types (such as XML, XSL, XSD, etc.) How can I create the file associations again?

The upgrade damaged the file associations in the LaunchService Database on your OS X machine. You can rebuild the LaunchService Database with the following procedure. This will reset all file associations and will rescan the entire file system searching for applications that declare file associations and collecting them in a database used by Finder.

- 1. Find all the Oxygen XML Developer plugin installations on your hard drive.
- **2.** Delete them by dragging them to the Trash.
- 3. Clear the Trash.

- **4.** Unpack the Oxygen XML Developer plugin installation kit on your desktop.
- 5. Copy the contents of the archive into the folder / Applications / Oxygen.
- **6.** Run the following command in a Terminal:

/System/Library/Frameworks/CoreServices.framework/Versions/A/Frameworks/Land'Services.framework/Versions/A/Support/Isregister-kill-r-domain local-domain system-domain user

7. Restart Finder with the following command:

killall Finder

- **8.** Create a XML or XSD file on your desktop. It should have the Oxygen XML Developer plugin icon.
- **9.** Double-click the file.
- 10. Accept the confirmation.

When you start Oxygen XML Developer plugin the file associations should work correctly.

Signature Verification Failed Error on Open or Edit a Resource from Documentum

When I try to open/edit a resource from Documentum, I receive the following error:

signature verification failed: certificate for All-MB.jar.checksum not signed by a certification authority.

The problem is that the certificates from the Java Runtime Environment 1.6.0_22 or later no longer validate the signatures of the UCF jars.

Edit the eclipse.ini file from the Eclipse directory and add the following parameter to the -vmargs:

-Drequire.signed.ucf.jars=false, for example:

```
-vmargs
-Xms40m
-Xmx256m
-Drequire.signed.ucf.jars=false
```

Compatibility Issue Between Java and Certain Graphics Card Drivers

Under certain settings, a compatibility issue can appear between Java and some graphics card drivers, which results in the text from the editor (in **Author** or **Text** mode) being displayed garbled. If you encounter this problem, update your graphics card driver. Another possible workaround is, *open the Preferences dialog box*, go to **Fonts**, and set the value of **Text antialiasing** option to ON.

Note: If this workaround does not resolve the problem, set the **Text antialiasing** option to other values.

An Image Appears Stretched Out in the PDF Output

When publishing XML content (DITA, DocBook, etc.), images are sometimes scaled up in the PDF outputs but are displayed perfectly in the HTML (or WebHelp) output.

PDF output from XML content is obtained by first obtaining a intermediary XML format called XSL-FO and then applying an XSL-FO processor to it to obtain the PDF. This stretching problem is caused by the fact that all XSL-FO processors take into account the DPI (dots-per-inch) resolution when computing the size of the rendered image.

The PDF processor which comes out of the box with the application is the open-source Apache FOP processor. Here is what Apache FOP does when deciding the image size:

1. If the XSL-FO output contains width, height or a scale specified for the image external-graphic tag, then these dimensions are used. This means that if in the XML (DITA, DocBook, etc.) you set explicit dimensions to the image they will be used as such in the PDF output.

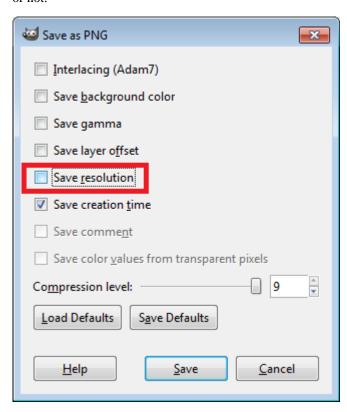

- 2. If there are no sizes (width, height or scale) specified on the image XML element, the processor looks at the image resolution information available in the image content. If the image has such a resolution saved in it, the resolution will be used and combined with the image width and height in order to obtain the rendered image dimensions.
- 3. If the image does not contain resolution information inside, Apache FOP will look at the FOP configuration file for a default resolution. The FOP configuration file for XSLT transformations which output PDF is located in the <code>[OXYGEN_DIR]/lib/fop.xconf</code>. DITA publishing uses the DITA Open Toolkit that has the Apache FOP configuration file located in <code>[DITA_OT_DIR/plugins/org.dita.pdf2/fop/conf/fop.xconf</code>. The configuration file contains two XML elements called <code>source-resolution</code> and <code>target-resolution</code>. The values set to those elements can be increased, usually a DPI value of 110 or 120 should render the image in PDF just like in the HTML output.

The commercial **RenderX XEP** XSL-FO processor behaves similarly but as a fallback it uses 120 as the DPI value instead of using a configuration file.

Tip:

As a conclusion, it is best to save your images without any DPI resolution information in them. For example the open-source GIMP image editor allows you when saving a PNG image whether to save the resolution to it or not:

Having images without any resolution information saved in them allows you to control the image resolution from the configuration file for all referenced images.

The DITA PDF Transformation Fails

To generate the PDF output, Oxygen XML Developer plugin uses the DITA Open Toolkit.

You can analyse the **Results** tab of the DITA transformation and search for messages that contain text similar to [fop] [ERROR]. If you encounter this type of error message, edit the transformation scenario you are using and set the **clean.temp** parameter to **no** and the **retain.topic.fo** parameter to **yes**. Run the transformation, go to the temporary directory of the transformation, open the topic. fo file and go to the line indicated by the error. Depending on the XSL FO context try to find the DITA topic that contains the text which generates the error.

If none of the above methods helps you, go to **Help** > **About** > **Components** > **Frameworks** and check what version of the DITA Open Toolkit you are using. Copy the whole output from the DITA OT console output and either report the problem on the DITA User List or to support@oxygenxml.com.

The DITA to CHM Transformation Fails

Oxygen XML Developer plugin uses the DITA Open Toolkit and the HTML Help compiler (part of the Microsoft HTML Help Workshop) to transform DITA content into *Compiled HTML Help* (or *CHM* in short).

However, the execution of the transformation scenario may still fail. Reported errors include:

- [exec] HHC5010: Error: Cannot open "fileName.chm". Compilation stopped. This error occurs when the CHM output file is opened and the transformation scenario cannot rewrite its content. To solve this issue, close the CHM help file and run the transformation scenario again.
- [exec] HHC5003: Error: Compilation failed while compiling fileName-Possible causes of this error are:
 - The processed file does not exist. Fix the file reference before executing the transformation scenario again.
 - The processed file has a name that contains space characters. To solve the issue, remove any spacing from the file name and run the transformation scenario again.

DITA Map Ant Transformation Because it Cannot Connect to External Location

The transformation is run as an external Ant process so you can continue using the application as the transformation unfolds. All output from the process appears in the **DITA Transformation** tab.

The HTTP proxy settings are used for the Ant transformation so if the transformation fails because it cannot connect to an external location you can check the Network Connections.

Topic References Outside the Main DITA Map Folder

Referencing to a DITA topic, map or to a binary resource (for example: image) which is located outside of the folder where the main DITA map is located usually leads to problems when publishing the content using the DITA Open Toolkit. The DITA OT does not handle well links to topics which are outside the directory where the published DITA map is found. By default it does not even copy the referenced topics to the output directory.

You have the following options:

- 1. Create another DITA map which is located in a folder path above all referenced folders and reference from it the original DITA map. Then transform this DITA map instead.
- 2. Edit the transformation scenario and in the Parameters tab edit the fix.external.refs.com.oxygenxml parameter. This parameter is used to specify whether the application tries to fix up such references in a temporary files folder before the DITA Open Toolkit is invoked on the fixed references. The fix up has no impact on your edited DITA content. Only "false" and "true" are valid values. The default value is false.

The PDF Processing Fails to Use the DITA OT and Apache FOP

There are cases when publishing DITA content fails when creating a PDF file. This topic lists some common problems and solutions.

• The FO processor cannot save the PDF at the specified target. The console output contains messages like:

```
[fop] [ERROR] Anttask - Error rendering fo file: C:\samples\dita\temp\pdf\oxygen_dita_temp\topic.fo <Failed
to open C:\samples\dita\out\pdf\test.pdf>
Failed to open samples\dita\out\pdf\test.pdf
............
[fop] Caused by: java.io.FileNotFoundException: C:\Users\radu_coravu\Desktop\bev\out\pdf\test.pdf
(The process cannot access the file because it is being used by another process)
```

Such an error message usually means that the PDF file is already opened in a PDF reader application. The solution is to close the open PDF before running the transformation.

• One of the DITA tables contains more cells in a table row than the defined number of *colspec* elements. The console output contains messages like:

To resolve this issue, correct the *colspec* attribute on the table that caused the issue. To locate the table that caused the issue:

- **1.** Edit the transformation scenario and set the parameter *clean.temp* to *no*.
- 2. Run the transformation, open the topic.fo file in Oxygen XML Developer plugin, and look in it at the line specified in the error message (See position 179:-1).
- 3. Look around that line in the XSL-FO file to find relevant text content which you can use, for example, with the **Find/Replace in Files** action in the **DITA Maps Manager** view to find the original DITA topic for which the table was generated.
- There is a broken link in the generated XSL-FO file. The PDF is generated but contains a link that is not working. The console output contains messages like:

```
[fop] 1248 WARN [ main ] org.apache.fop.apps.FOUserAgent - Page 6: Unresolved ID reference "unique_4_Connect_42_wrongID" found.
```

To resolve this issue:

- 1. Use the Validate and Check for Completeness action available in the DITA Maps Manager view to find such problems.
- 2. If you publish to PDF using a DITAVAL filter, select the same DITAVAL file in the **DITA Map Completeness** Check dialog box.
- 3. If the Validate and Check for Completeness action does not discover any issues, edit the transformation scenario and set the *clean.temp* parameter to *no*.
- **4.** Run the transformation, open the topic.fo file in Oxygen XML Developer plugin, and search in it for the unique_4_Connect_42_wrongID id.
- 5. Look around that line in the XSL-FO file to find relevant text content which you can use, for example, with the **Find/Replace in Files** action in the **DITA Maps Manager** view to find the original DITA topic for which the table was generated.

Navigation to the web page was canceled when viewing CHM on a Network Drive

When viewing a CHM on a network drive, if you only see the TOC and an empty page displaying "Navigation to the web page was canceled" note that this is normal behavior. The Microsoft viewer for CHM does not display the topics for a CHM opened on a network drive.

As a workaround, copy the CHM file on your local system and view it there.

Alignment Issues of the Main Menu on Linux Systems Based on Gnome 3.x

On some Linux systems based on Gnome 3.x (Ubuntu 11.x, 12.x), the main menu of Oxygen XML Developer plugin has alignment issues when you navigate it using your mouse.

This is a known problem caused by Java SE 6 1.6.0_32 and earlier. You can resolve this problem using the latest Java SE 6 JRE from Oracle. To download the latest version, go to

http://www.oracle.com/technetwork/java/javase/downloads/index.html.

To bypass the JRE bundled with Oxygen XML Developer plugin, go to the installation directory of Oxygen XML Developer plugin and rename or move the <code>jre</code> folder. If Oxygen XML Developer plugin does not seem to locate the system JRE, either set the JAVA_HOME environment variable to point to the location where you have installed the JRE, or you can simply copy that folder with the JRE to the installation directory and rename it to <code>jre</code> to take the place of the bundled JRE.

SVG Rendering Issues

Oxygen XML Developer plugin uses the **Apache Batik** open source library to render SVG images. The **Batik** library only has partial support for SVG 1.2: http://xmlgraphics.apache.org/batik/dev/svg12.html.

For example, if you are using the *Inkscape* SVG editor, it is possible that it saves the SVG as 1.1 but it actually uses SVG 1.2 elements like flowRoot inside it. This means that the image will not be properly rendered inside the application.

MSXML 4.0 Transformation Issues

If the latest MSXML 4.0 service pack is not installed on your computer, you are likely to encounter the following error message in the **Results** panel when you run a transformation scenario that uses the MSXML 4.0 transformer.

```
Error Message

Could not create the 'MSXML2.DOMDocument.4.0' object.

Make sure that MSXML version 4.0 is correctly installed on the machine.
```

To fix this issue, go to the Microsoft website and get the latest MSXML 4.0 service pack.

Glossary

Topics:

- Active cell
- Apache Ant
- Block element
- Bookmap
- DITA Map
- DITA_OT_DIR
- Inline element
- Java Archive
- Named User

Active cell

The selected cell in which data is entered when you begin typing. Only one cell is active at a time. The active cell is bounded by a heavy border.

Apache Ant

Apache Ant (Another Neat Tool) is a software tool for automating software build processes.

Ant

Block element

A block element is an one that is intended to be visually separated from its siblings, usually vertically. For instance, a paragraph or a list item are block elements. It is distinct from a *inline element* which has no such separation.

Bookmap

A bookmap is a specialized *DITA map* used for creating books. A bookmap supports book divisions such as chapters and book lists such as indexes.

DITA Map

A DITA map is a hierarchical collection of DITA topics that can be processed to form an output. Maps do not contain the content of topics, but only references to them. These are known as topic references. Usually the maps are saved on disk or in a CMS with the extension .ditamap.

Maps can also contain relationship tables that establish relationships between the topics contained within the map. Relationship tables are also used to generate links in your published document.

You can use your map or bookmap to generate a deliverable using an output type such as XHTML, PDF, HTML Help or Eclipse Help.

DITA OT DIR

DITA_OT_DIR is the default directory that is specified for your DITA Open Toolkit distribution in the *Window* > *Preferences* > *Oxygen XML Developer plugin* > *DITA preferences page*.

For example, if you are using DITA 1.8, the default DITA OT directory is: [OXYGEN_DIR]/frameworks/dita/DITA-OT.

Inline element

An inline element is one that is intended to be displayed in the same line of text as its siblings or the surrounding text. For instance, strong and emphasis in HTML are inline elements. It is distinct from a *block element*, which is visually separated from its siblings.

Java Archive

JAR (Java ARchive) is an archive file format. JAR files are built on the ZIP file format and have the .jar file extension. Computer users can create or extract JAR files using the jar command that comes with a JDK.

Java Archive (JAR)

JAR

Named User

Named User is defined as an individual full or part-time employee who is authorized by *You* (the individual or entity who owns the rights to Oxygen XML Developer plugin) to use the software regardless of whether the individual is actively using the software at any given time. To avoid any doubt, Named User licenses cannot be shared amongst multiple individuals and separate Named User licenses must be purchased for each individual user.

A Named User license may not be reassigned to another employee except in the following circumstances:

- (a) Upon termination of the Named User's employment with your company.
- (b) Permanent reassignment of a Named User to a position that does not involve the use of the Software.

For example, suppose Jane has been assigned an Oxygen XML license and she leaves your company. When she leaves, you can simply reassign her license to John, her replacement. In the event that you do reassign the Named User license in accordance with the restrictions above, you do not need to notify Syncro of such a reassignment.

Note: This definition is taken from the Oxygen XML Developer plugin *End User License Agreement*.
